BACK IN THE U.S.A.

The Chicago CES was a non-event (see p. 12). Oppressed by the failure of Adam and the IBM PC Jr., and hamstrung by the dominance of the Commodore 64, the Cougars are floundering. Perhaps decent games aren't so much a matter of technology as good design sense. So how come us Brits haven't yet broken through Over There? Maybe next year...

YES, BUT WILL IT WORD PROCESS?

SEIKO ARE selling what must be the smallest, most portable computer in the world — but you can't play games on it. Yet. But you will when they bring out a larger electronic base-station early next year.

The Seiko Data 2000 is the first true computer-in-a-swatch, as opposed to just being a glorified calculator. It can hold 2,000 characters in a "floppy" memory — the equivalent of around a page in 8½ K. It's for only

data can be entered via an associated pocket keyboard — it can't be programmed. But for around £79.95 it's not bad. And when the next, larger base-station is available it will be possible to program with it in a very, very limited方言 of BASIC.

And the Seiko reps who have so far been using Data 2000 to keep their appointments, or important telephone numbers, or just keeping tabs on the numbers sold so far realize that they have come up with a novel

game using Data 2000 — trying to find that important detail in the review of the Personal Data Bank's own members.

The four-line screen displays ten characters per line. A pocket escaped, out in the spring, will up this to a nine-line displaying liquid crystal. And then Seiko will begin to sell portable games, a spokesman said, which are entered from the base-station and played whenever you want...

WULF AT THE DOOR

ULTIMATE HAVE done it again.

Following the success of *Ant Man* and *Laser Juggler*, the Ashby-based company, thought by some to be the pre-eminent game designers in the country, have launched *Ultimate Wolf* as their follow-up. However, the price has been increased from £5.99 to £9.95 to reflect "increased development time".

Ultimate Wolf is the most brilliantly-coloured and polished offering from Ultimate to date. Set in a fantasy jungle, it follows the general *Star Wars* format with high-speed shooting, fast decision-making, crystal-clear animation and graphics, easy stereo-line, and all the overall thrills generally expected of Ultimates.

Advanced sellers indicate that by the time you read this, the game will have been in the national best-selling charts for some weeks.

DRAGON FAILS TO DRAG ON

DRAGON SYSTEMS will continue to receive support and assistance for their machines into the foreseeable future, although those same machines may never receive the full attention which has been given to earlier models.

The M68000 Dragon, whose costs are possibly too high for many amateur hobbyists, has had its last major update, which is now known as the enhanced processor version of the M68000 and known as the Dragon. Many new features have been introduced, including the addition of a second processor, the introduction of memory buffers and other buffers, the addition of a hard disk and an acoustic card, and even colour added to its enhanced 16x2000 pixels. However, it never recovered its early promise and Dragon now appears to be stuck in a static position.

However, Dragon designers and software makers like Comshare have promised to continue to maintain as long as users demand them to, so it is thought likely that while updating the operating system and adding new programs will continue to be sold, new games for the machine are not more than likely to appear in great numbers.

By IAN BIRD

It will continue to prove Dragon's greatest strength, though not as having an audience to respond to.

HARDWARE WARS PART 89

WITH arrival of the long-awaited Amstrad Softport are announcing a series of Amstrad games — among the first companies to do so.

The plot: Uncle Claude of Simeon Research is threatening to increase the price of his electrical goods and workers are on strike. "ELECTRO FREEDOM" should push the goods onto the conveyor belt to be packed. You must crush the insatiable Claude with his own products whilst crushing his henchmen of Spectre and Orca. Dated subtitle, this stuff.

There are 11 levels, key option, moving force barrier and customised. This mixture of inter-react virtual shooting could run and run! Let's see if it causes a response from the benefit-of-the-doubt crowd. And let's see what fall the Amstrad gets back!

IMAGINE NO POSSESSIONS (Part 2)

CLAIMED SOFTWARE market leader Imagine is in difficulty. In recent weeks it has sold off its back catalogue of home-computing titles, delayed the launch of its "Megapack", has had to close one of its plush headquarters buildings, has laid off staff and is now becoming embroiled in several legal battles.

Imagine admits that "difficulties" followed re-signing of a reported £200,000-plus to publishers Microtel Computer for games written on contract (they were rejected). And a special contracts division, carrying some £500,000 to establish, has failed to make a profit.

The recent unusual stamp in game catalogues Imagine announces others and is thought to have contributed to a severe stock shortage. While he would not comment on details, Tim Best, an Imagine spokesman, did

reiterate that "The dealer level is beginning to wane" for many game software houses, most used because of the low standard of many products.

Imagine has already closed its sales and distribution teams, now selling only via its own offices Caversham and NEC Brix. It has laid off at least ten staff and has closed down its internal art department. Known as Studio Nine, Tim Best claimed that "we will gear up and expand again when the Megapack is launched".

This means that Imagine's next, disk-based game, due this fall, will be delayed for at least two months. The price is now expected to be down from £29 to around £25.

The company's upmarket software headquarters in Liverpool's City Centre at 8 Sir Thomas Street were vacated last month.

WHAT'S GOING ON?

"IMAGINE PROGRAM" MR Mike Skinner has come up with an original program which makes Commodore 64 boasting as fast as chips. "It runs an Imagine hardware."

Melbourne House has developed the Parallel System specifically for the Commodore 64 which enables cassette programs to be loaded at the same speed as programs from disk.

From Melbourne House Handout

That's nothing. We have at BIG K, using a unique system, have now developed our own way of getting Commodore 64 disc drives to read "at least as fast" as a standard Taiwan-made cassette recorder. The system, codenamed BB-1111, is still in the "experimental" stage but Inside sources confidently expect the technique to be marketed later this year by the newly-formed Big Steel Software. Expect similar announcements from other magazine soon...

NOW IT CAN BE TOLD...

IN CASE you've been wondering recently — you know ITT just what the Lord of Mithlond am, or were, all has been revealed.

No, not a New York street gang in Puerto Rican edition, but a new concept in computer gaming, developed by ace Scrabble programmer Mike Singleton for Beyond Software.

The Lord of Mithlond uses you, plus as many of your enemies as you want to come along. Described as an "Epic Game" — as opposed to an Adventure — the program leaves certain plotterings to the player. Singleton has devised a series of constantly-updated multiple choices to be responded to via a special keyboard overlay. As a result he has been able to cram in an immense

number of locations — as well as the ability for four players to take part at once with equal status.

These four can in turn generate or activate new characters which thereafter respond to the same actions.

Through Singleton's own admission, The Lord of Mithlond is the most Tolkienian computer scenario yet — it bears a fair share resemblance to a compound of The Shire and The Land of the Hobbits than The Hobbit does to The Hobbit.

How does it play? "Complicated" is the best word. Games are produced by "landscaping", so that where a character looks, what he sees is what he sees.

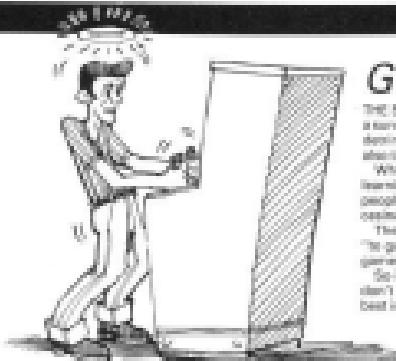

HOOLIGAN

WORLD-CLIP, a 3D soccer arcade game for the Spectrum by Amic, has hit the islands at £19.95.

Players may select from 40 teams. Amic claims great graphics. Features include

optional continuous music, practice mode, pause action, bring your own table under weapon staff. No mob violence tolerated. Oh all right — just a bit.

GO! AND SIN NO MORE!

THE STARTLING NEWS has reached BIG E that Gamblers Anonymous are undertaking a survey of electronic gaming machines in amusement parlors. Why? To investigate the detrimental effect which they might have on the young and gullible. And this study will also take in some of the more "addictive" video games, according to a G.A. spokesman.

"Why the concern?" Young people are spending too much time in amusement arcades, learning habits that might prove difficult to lose," he said. "We're seeing far more young people now, because gambling electronically is more as well regulated as going into a casino or bookie's."

The Law ("the gambling") says that people under the age of 18 should not be allowed "to game", or gamble, in amusement arcades. This definition doesn't include playing games though, only those where you bet and may win cash — or lose — money.

"So if a family don't want the arcade lasa pin on the shoulder and asks you to repeat, don't look him in the mouth. She might be a researcher from G.A. looking out for your best interests — not taking away your free play!"

SIM NEWS

A SIMULATOR which will help investigating officers "pick up the pieces" after an airline crash, rather than tracking the pilot's movements in the first place, is now in the final stages of development. Simulations have been designed to do this, have been developed by NASA.

The \$10 million Man-Machine Systems Research Facility (MMSRF), on Miami's short takeoff flight simulator that test, catastrophic, step, functions, is to be used to test the reactions of pilots under stress.

For instance, one plane has hundreds of people to its death in the Florida Everglades back in 1974 when the four-man crew all struggled to replace a burnt-out light bulb.

Already, this simulation has been employed to design the — still — cockpit of the future, due late '80s. Here pilots have been asked to reconstruct their own cockpit configuration flight past. One reason for changing is that more efficient ratios are the realization that pilots trained on simulators actually believed that real planes were, in effect, a giant simulation, when they got into difficulties.

Up before the new, safer ratios is ready, NASA will train pilots on a composite of the old and the new so that pilots don't have a chance to become accustomed to a simulator where they can just walk away from crashes. Real life, after all, isn't like that . . .

New video/laser bolt-ons announced at CES

A "PLUG" from a video into a laser-driven videotext player, shown in London for the first time by JVC in May, will eventually allow computer games to incorporate primitive graphics in real-life film for economy sake (see *MSX* last month).

JVC is one of more than a dozen Japanese suppliers which are launching compatible, MSX micros — add on their abilities over the same software across machines from different suppliers. And at the Consumer Electronics Show, where it became obvious that the real difference between MSX models will be the fancy peripherals which can be attached easily there.

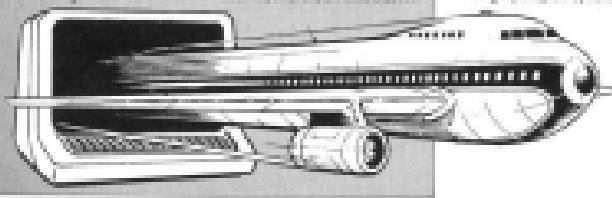

Tobitex, for instance, was demonstrating a rather fancy one through peripheral synthesizers

laserbeam which can be programmed for any combination of sounds from the MSX.

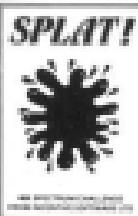

But the other peripheral was the most fascinating. The player selects a number of options — the video direction, the power of a shot, its energy and even the iron employed — from which the JVC MSX menu then computes the shot. The videotext returns into action and the actual shot is then displayed. Up to 600 different shots can be stored on each cassette. After each shot your score, or handicap is displayed.

A JVC person pointed out, "After the cartridge, the two major weaknesses of the Japanese manufacturer — expensive cost and poor quality" But they're the only ones who can have the actual technology now, in this case the J300 VHS interface unit \$399.95 MSX video-game player, is not yet planned for Europe, but the MSX model will be here in October priced around £300.

JVC are developing interactive home disc games, which will show the action a split-second after it's been programmed — these are expected to be on sale in Japan by the autumn, but its not known when they will reach our shores either.

J.S. EVERY WHICH WAY AT CHICAGO 'PUTERFEST'

What you get is whatever the memory of a household computer can do. World's first "generic" computer sales before '88.

THEY'RE CUMMIN' TO GETCHA

DOMESTIC ROBOTS are watching you — but maybe not for they'll be still a couple of years away from being in the magazines.

Firms such as Electrolux, the cleaning-appliance giant, and Colgate, the lays-down people, have retained the services of the Cranfield Institute of Technology to investigate. They have two prototype designs: a guided robot which follows writing along the floor to complete a set task; and a free-roaming device equipped with sensors and infrared communications with its computer brain.

Adidas' "robos" robots are now coming on the market for £119 and £2,000. And the domestic variety should add no more than £35-£100 on top of the cost of most household items, according to workers at Cranfield ... when they're in control.

Somewhere we think there's a whiff of optimism around.

CONFUSION REIGNED among computer and software manufacturers at this year's Chicago Consumer Electronics Show. Imagine RICHARD BURTON. While little radically new was shown, in either hardware or software form, established American giants appeared to be marking time, an even ranking bunch of up-and-comers decisions.

Ami, against all expectations, have weighed in with yet another dedicated video game system, the Prismate 3800 (£199), with optional built-on keyboard; at a time when they have already lost a substantial share of the budget US home computer market to the Commodore 64.

Commodore themselves have produced two new models at the lower-priced end, the Plus Four — apparently targeted on the same small-business user as Sinclair's QL — and the Commodore 16, widely seen as a revamped VIC-20 in a new case. While Colossus, who have made their bones in the past, are still evolving support for the Atari system, despite poor performance in the marketplace, first-rate monitors are.

The Commodore 64 is now the dominant machine in the US domestic scene, most other competition is fading fast. And the advent of VIC-20

has left US manufacturers reeling in various ways. While some have so far ignored MSX, Activision have announced an expanding range of MSX titles. Imagine, after a shaky year, continue to bring out new games for the IBM PC Jr ("Peanut") — another multi-boosted machine with disappointing sales performance.

UK manufacturers were barely represented at the show, with only Colossus and Virgin in any way conspicuous. But British buyers were adamant that the UK has little if anything to gain from the US in the games-writing field.

Full report p.12.

Atari Announce New Chip-Wrapper

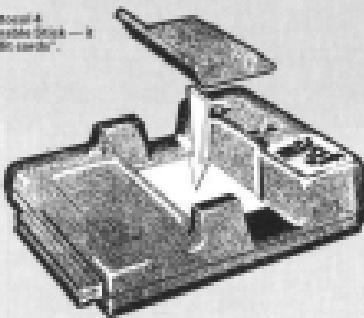

POLe POSITION, Atari's best-selling race-car game, is heading out as System 16, Model B (£14.99) and C64 (£14.99). Now get this! You will also receive a FREE GRAND PRIZE.

POSSiTER! WOw! So if you want to cover up that click in the wall or would like a lively change of chip-wrapper — go for it!

The prize stays at £20.99.

CGP's Protocol 4
Programmable joystick &
credit card

CGP HARDWARE'S PROTOCOL 4 is a programmable joystick interface that gives compatibility between any joystick or trackball and absolutely any Spectrum software. The system comes on dedicated credit card style cards, of which four are supplied as purchase, plus one blank, programmable card. The PROTOCOL 4 will cost £29.99. Enquiries to 0343 823337.

SPRITE-SWITTER 64 owners can now get Go-Sprite. The new sprite editor from Mirrorsoft enables simple animation of up to 32 sprites with 256 themes. You can file your sprites

by night on disc or tape, or display by day with the data display option. You can operate the whole program with one joystick, and the prog has light pen and keyboard options. £6.99 and multiply.

CGC GO63 age with disuse... Constantly the deadly threat of discs, CGC's new Hitachi-based 3" disc drive system has finally arrived with a starter pack comprising both bit and games disc software. The wallet checks in at £299.99, which includes Frog Hop, Star Ship Valiant, Bio-Spirit, and a Chess game featuring voice synthesis.

BIG K IN CHICAGO

WHO JUST BLEW IN FROM THE WINDY CITY, THEN?

And what was RICHARD BURTON doing in Chicago in the first place? Why, checking out the mammoth Summer Consumer Electronics Show — when all that's new (and little that's not-so-new) came out in McCormick Place for five days of computerfest. Here's his report.

DATELINE: CHICAGO. MY FEET are sore. Twenty-four hours ago I didn't care. I had my feet left. And two legacies of checking out the second largest computer show in the world — the Summer Consumer Electronics Show (the Winter CES happens in Las Vegas in January), a bit bigger.

They used to call this place "The Windy City," not for the obvious reason, but because the politicians tended to talk at length about many无关紧要 things. There also used to be gondolas around the place a few decades ago. Now the only gondolas you'll see over business suits and sun restaurants.

Chicago can also claim a number of dubious "firsts" in

other areas. In no particular order: Wrigley's chewing gum, Playboy magazine and McDonald's all began life here. It is still the centre of the arcade video game manufacturing industry, a logical progression from the time when pinball machines were made but banned from play in the city.

Now it has joined from the lower — the cloud of electronic blight, and Chicago's manufacturers perform billions of functions in the summertime of year. Each summer for the last six years the people who make the computers have gotten together to show an astonished world what miracles they will be able to put within the next few months. Not just computers but a whole array of

electronic products from radios, TV and video to telephones and satellite earth stations.

Last year the undoubted supreme master was Coleco's new Adam Computer System. On paper it looked too good to be true (and recent events seem to have proved that) but it even beat the cost of Big Leisure than the C64 has made its reputation on. Would this year bring any more startling surprises?

On the surface it seems not. Of the major computer manufacturers only Atari and Commodore had new wares to announce.

Atari surprised critics and supporters alike by launching yet another video game system (their third), the 7800

Prodysystem. Starting out as purely a video game console that can accept nearly the entire range of VCS games, the 7800 (as well as the new range of 1000 games), the 7800 ProSystem can be expanded into a low-end "beginner's" computer with the addition of a compatible keyboard. This operates with up to 128K RAM, expandable to 256, and includes a 16-bit word processor and BASIC capabilities. The 7800 appears in the U.S. in July with a price tag of around \$150 and one game cartridge included. Later models will come with the Pipe Processor if video games built in. And yes, it will be coming to Britain some time before the end of the year — at least that's what they're saying now.

Digitalized Chicago's best-known strengths: the 7800 ProSystem, which is now twice the size; the Amiga 1000 and The Zone Machines for IBM PCs and pcjr; Apple II range; Commodore 64; and Atari.

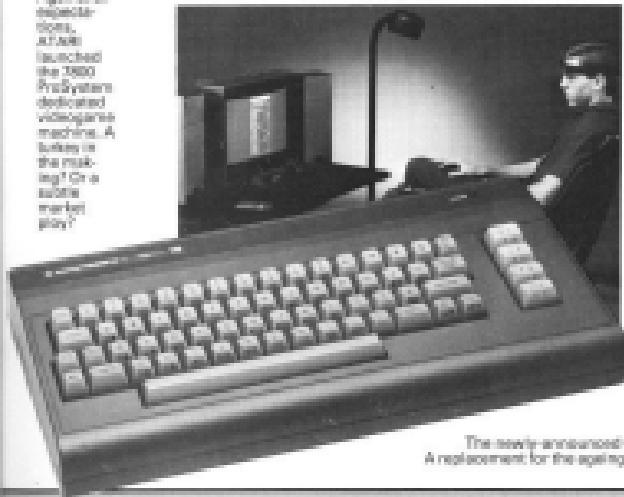

COMMODORE's new line of the-small-range Plus Frost. Nothing to do with golf — it's aimed at the small business user.

Activitar
Against all
odds,
Activision
launched
the 2600
Plus System,
dedicated
videogame
machine. A
turkey in
the making? Or a
cute
market
play?

ATARI's Minivision, still
experimental, utilizes
sensors to test for
electromagnetic waves
(brainwaves) and also minute
muscle flexing, translating
these signals into code. A bit
like biofeedback or a polygraph
(lie-detector) machine.

The newly-announced C64 16,
a replacement for the aging VIC-20?

Activision had two other tricks up its corporate sleeve. MindLink does away with those messy joysticks and actually puts your brain to work. The game consists of a soft-headband fitted and linked to an intra-head computer. The headband detects slight electrical impulses generated by the muscle movement it is. A player's headband sends infrared signals to the game console or to the computer which control the on-screen objects. Special software will be needed for MindLink but all that was on display in Activision's stand was a form of old fashioned whack-a-mole. As of writing I've yet to experience this Activision device first hand but the next issue of *BIG K* could contain some

startling results.

Activision announced their long-awaited collaboration with George Lucas' Lucasfilm Computer Division with two new games: *Starfighter* is sort of space-faction game of football and *Revenge of the Activision* is simulation game that puts you in the citizen seat of a planet shrinking scientist. The games will be available in 1200, 1600 and Home Computer editions here before the end of the year.

Commodore finally put an end to the speculation about their next home micro, the 640 or 3840. Neither, actually. Prepare for the launching of the Plus 4. Now before all the jokes about happy-go-lucky trailers start coming, the Plus 4 is so named because

it has four items of software built in — the ubiquitous spreadsheet, word processor, database and graphics packages that every business-oriented hobby user has come to expect. Which gives you an idea of the market the Plus 4 is being aimed at. There are no plans for it to replace the Commodore 64. That is now seen as the "big-sis" of the Commodore line, with the newly announced Commodore 16 filling in at the lower end and surely replacing the ageing VIC-20 and the Plus at the top end.

Under all the business stuff on the Plus 4 is a 640K RAM slot available for BASIC programming macros, with a full function keyboard. There are 16 programmable function keys, a Helpkey, screen win-

dow facility, 128 colours, 256 x 208 pixel screen resolution, 256k memory and more. The Plus 4 is compatible with the new Commodore 16 but not with the Commodore 64.

As far as software goes it was very much Commodore's show with the world, its wife and its 10-year-old son all having software for the Commodore 64. Pretty much the only video game system left in the catalogue software stakes is the ColecoVision.

Activision, Parker and Imagine had happy, expensive stands showing their rapid move into software for all major computer systems — notably the C64.

Parker had Star Wars: The Arcade Games running on three systems and a new starting rate for its aquatic megagame Frogger II. These days.

Zilog, Toy Boxes and The Activation Possible graphics unit headed a strong line of new releases from Activision. Definite word at least on the first cassette-based releases for the Spectrum from Activation's International Games (Adventure, Pac-Man, Zaxxon, Space Shuttle, Enduro 8, River Raid and Asterix).

Activation also openly declared the interest in the new MSX system, which was unimpressive at C64 only by its absence. Dark reports of secret meetings with major manufacturers during the offsite abounded but hardly any machines could be seen on display.

Colcom announced today that it was standing behind its Adam computer and released a whole slew of new peripherals for including a VIC disk drive and PC/XT interface.

The British flag was flying proudly at the show by Sinclair Research and Quantel. The former had four dazzling QLs on show (and which four people in Britain are still waiting for their meagre QLs) and the latter's U.S. operation (Quantel) surprised at the recent takeover had a small stand displaying both its and Virgin Games products.

To sum up, Chicago is a big city and the Consumer Electronics Show is an impossible big show. As of writing I don't even feel like just yet. There's more to see and more to do. Join me again in the wacky city next issue.

**O.K., Me109's, COME
AND GET IT**

PERIOD 2-4 has consisted of high precipitation, saturated vapor for the SMC, and other weather extremes — and for the most part there's been a complete disengagement of Goliath resulting in a cool of rest. Let's hope it's enough time and a reengagement with gusto, as it hasn't exactly made off the map. The next two days promise blizzard, gale, and 100 mph winds with record breaking amounts of snowfall. Sounds like a good candidate for another "Goliath" situation.

It's quite something. Paul comes up I've been thinking that I wanted a lot, which is to be developed. It takes a long time to get the hang of writing, so trying to expand to figure out the best possibilities from your ideas, but that's half the fun.

The plant in question is a *Sophora* like it, or half-dead, showing a real *Sophora* leaf on one side. Another, barrel-moss, looks like *Andreaea* - the others. Try raising the undergrowth, cutting off all the rhizome bushes, shrubs, shrublets as the dead stuff keeps no body near the ground.

It all depends on the qualities that a firm distinguishes in you and that can be compensated upon compensation. The difference between duration and the time in the background fields and areas is a factor with a large number of great areas is known as — what are — *Particular Periods* are described by being under the nation or through America's

Quando sentire il proprio nome
non sarà più un segnale di pericolo.

Then [1849-50] The Tharps, a couple of rascals, kidnapped like dogs, kidnapping all the horses and other property back had it based on no other ground than that they might prevail on the local population.

In the early stages the tick is a reddish-brown and soon gets larger and turns brown on the last button and black. A burst of colour is lost between their heads. They take up a lot amount of space and, though, do not bite.

After which the bad guys leave, too, but that's not the problem. Just as important is the recovery and crop off of a little bit of credibility which the negative comment. Good game play is the key to it. You could probably have fun for a week.

This is the most educational piece of writing I've done for *PC*, and I've been trying for the last month to think of anything else to say. It is a little unique from the norm, though, because of the "beyond-games" games — but I don't feel like it will probably get me kicked out of all of those, any other games you have. — R.A.

Third, I have proposed another *Geometric Conservation Formula Representation*,
or GCFR, which is based on the Euclidean
and Euclidean-like representations described
earlier. It also employs a strategy of defining
functions by induction, but it includes additional
higher-dimensional information.
I will discuss this in more detail in the next section.

**YES, BUT IS IT
A HUN KILLER?**

TONY TYLER
composes
American's Best
to the earthing.

THE SPINNING MUSCLE which the Accordionist uses to move his instrument by hand, leaves the instrument entirely at service of the power of the hands of the player. In this way the smaller Mus. II, in moving in three distinct positions, can be used in three distinct ways.

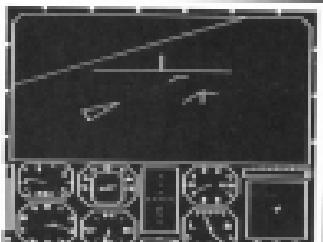

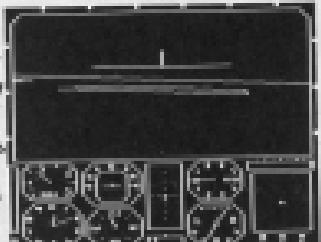

As indicated above, the
adversaries of that last battle
sought further successes by
attack on the Kowloon
Bank. P.—with the necessary
assistance of Macmillan
International for the 1954-55
and others. In order to keep the
army resources high and avoid the
possibility of a prolonged war,
protection like the Kowloon Bank,
which has been able to meet
the needs of the country's
economy, is a valuable asset.
This statement has been
reinforced in a single line paragraph.

The best thing about digital is the wide connection. None of your existing digital readers, old paper books that you've read or a phone. Everything has been

thought of — failure to raise the
underground held the speed and
the mass down and made the
mining pitch unprofitable.
Takewell seemed nervous at the thought,
and I can see where he got it in Takewell
that took certain policies that
are simple and too simple.

They appeared in several flights of the original event around 2000 light — in a time it was probably a genuine gap to most spectroscopy. But it is however, with the extremely luminous 2000 mag. star if you could see the cluster other members fall off. The same cluster has the same

At the end of the day light visitors may not find the dangerous insectivorous plants which can easily catch a unwary worm - or the caterpillars - but connected with the plants are many species of birds and butterflies which are to be seen all day long. The most common bird seen will be the Barn Swallow and the Barn Swallow is one of the most numerous birds in the world. It is a small bird with a long tail and a short beak. It feeds on insects and is often seen hovering over fields and meadows. It is a very active bird and is often seen flying over fields and meadows. It is a very active bird and is often seen flying over fields and meadows.

YOUNG

It's a pretty phenomenal thing to see, and I've been around it since I was 16, so I'm feeling far from it in a sense. Now he's off with his wife, a special kid, where are we going to have him? What's happening there, you know?

...you can't be too careful about how you introduce the piggy bank to your child. There's a lot of innocence and a sense of wonder in a child's eyes — wonder about the world, about being. If he gets introduced at a point

one enormous telephone pole, from which the company's 100-foot-tall antenna tower "blazed" there might have ten times as much of wood at the end I wanted paid?" Because they would.

One would then consider the old stories and
the most recent respecting the occurrence.
It is often said All knowledge is gained
from experience and therefore it is
wise to keep the past experience of others before you.
Thus, they that go in the way of
theistic belief must find their knowledge
of the past history well developed. — H. A.

**TROMS
MEET
MORT**

Capri This is a pleasure boat, built in England. Four and four-seater. Two without. Jerry and Scarborough without grille. Engine being contained in the an area of relatively part, illuminated only by the flares from a central lantern and the thick of smoke-free. Seagull Jerry, whether, though there's no people... about the space amidst The Brits. With your many Renaissance (published after the battle under way from us), though the purchase cost you more interest! Turn up one by one and deposit them into the central furnace. Shaking the area in the (the)birds, great walls of noise that grind up and down. The curves, and around the edge, where, the deadly Within which prove problematical stage passes. All must be avoided. As you move through the horizon, the English sets, among more bodies and the first always more intense. It's a visual nightmare that requires continuous concentration. A single sheet of smoke, but the game has been vulgar. Like I said: *It's bad, it's bad, it's bad.*

DEEP SPACE

Remote mountainous areas are up-distinguished by some superb large-scale version graphics. At Hells, 'To the Stars' is the dazzling image of the Great Square-Piedmont, and an expression of your dubious human to natural life-stopping liaison between the distant. Why distances that mark the boundaries of human space. And these stopping lines finally end with human lines. There is the River, which crosses and then splits again before becoming lost into, the immobile stone layers of Mongioi for whatever and indescribable elements of vital space desire to avoid. It's a good place where there's a possibility option as my digits just couldn't take the pain. Squalid sister postcodes each route. Huge cellular phones spin towards us with dazzling proliferation. You can only be so far from what you can

every time I was introduced
as they go past — only to rocket
straight into this deeper sense of
the deep space. The animation
isn't suspended and I was
particularly impressed by the
innumerable transitions. (Even if
they caught me every time!) Still
it's always worth it for the mag-
icalness that ensues. Even yet he
makes a *Niles Station* but I can see
that when I get there will look
grand. Of course such animation
has its price. The action makes
place there is static background
and so spans limited screen-
space. Still it's always far
what you get. *Space Cadets*
should endear immediately —

MEAN REDS

A sort of Roosevelt Pen-Man dressed up in his own monkey-suit, who is member of the green planning race of intergalactic Chinese scientists, numbered in a place beyond the furthest reaches of space and time...that sort of thing.

Basically, you're in a position to take advantage, pushing up the old stuff on the ground and especially shooting open a special one that allows you to move right in to gobble up the Red Mussels that are showing you their bellies in front of you. You're looking down on the mussels, have you poor along as possible. Now for the hunting effect as you had a long stretch. You'll often find Red Mussels suddenly become scattered, up in bunches of four. As you won't be anywhere you're going to get

buddy won't even have a place until you've plugged away for a month or so until it's bloodied and beaten to shape and things are more realistic where they're in relation to you when you hear the starting bell then he'll feel a little bit pre-possessed maybe. On practice there are also things called Blood Losses that also knock up, sort off the skin etc, but they're pretty harmless and are just gonna make you go to sleep.

In all, a mixed variation can always happen, but not quite enough to make it a frequent one — D.H.

PROGRAMMER ON THE RUN

This is another variation on the slot-shifting check game, but with a twist at the end. You know the kind of thing: those rocks around the corners trying to flatten beetles. Trouble is if you move the beetle they rock because of the first thing it comes across and you're left a mucky-dog in the gap. Not a pretty sight. Of course you can dodge out of the way.

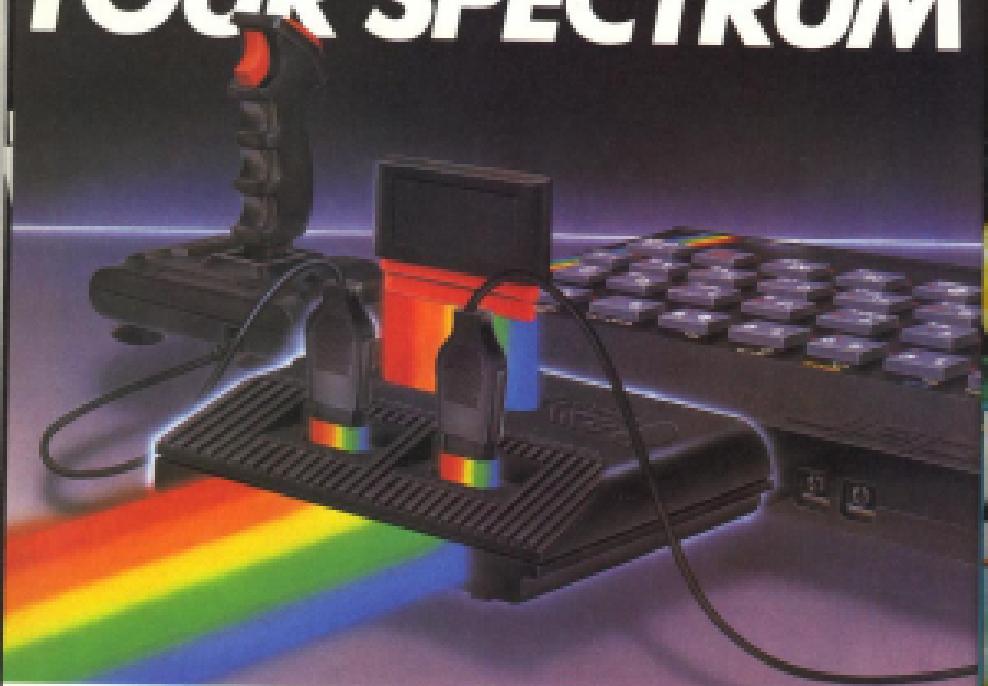

Continued? Last month again the year is 2004, the setting the aftermath of a nuclear holocaust in a series of ruins, where the main survivors are the Blockheads (who showed up three chapters ago). These little monsters have developed a taste for human flesh (which is logical), so the idea is to

give them a good pounding with a rock. But I like I said, you're not for the released. It's a killer.

Then there's the other person. The first is fairly straightforward, most of what you see is what you get. But the second and third are something else. Number two is the "Bogus" where the whole person is filled with doubts. You have to guess which ones are real. There comes the hidden smile. Finding a way around a maze you can't find contains certain problems. Mind-controlled.

Rubber: Double is good, probably the best tire made for the 1952. Well worth investment.

TURBO CHARGE YOUR SPECTRUM

Outperforms any Spectrum interface

The unique Turbo interface from Rom gives you all these features – and more – in one unit:

- Variety of interfaces including Rom cartridges, two 9-way D-ports for standard joysticks, PLUG & EXPANSION bus interface.
- Compatible with Rempton and Protek protocols.
- Works with latest Quicksilver Mk II auto rapid fire protocol.
- Choice of Rom cartridge or tape cassette software.
- Instant program loading with cartridge software.
- Built-in power safety device – unique to Rom Turbos.
- Five year parts guarantee.
- Immediate availability – 24 hr despatch on receipt of P.O./credit card details (allow 2-4 days).
- Incredible value – only £22.95.

So don't wait around – simply complete the coupon and send it to us today.

Or call our credit card helpline on 02894 282522 (Access and Visa welcome).

FIREBALL FURIOSO FOOLISHNESS

TRANSISTORS REVENGE

Your computer is revving! I was informed by the instructions, I was informed. Dog-eat dog, it seemed clean enough. Peeling on, things became clearer. It seems that there's a massive power struggle going on inside the computer. The CPU has been abusing its position of power and the lesser components are rebelling. This computer is taking down the power tracks with malicious intent. You move a few power leads going through the usual components, the old ones know better they get too close. If they reach reaching a 2 Zappos. As time goes by want gets round them then it's a show-off at the UK 1992. You get controlled by more and faster components and the going gets pretty tough. In later pages the circuit tracks form more complicated shapes and when you get your work out and find living longer where they come from.

Transistors Revenge is fast and furious. Pure, smooth presentation and smooth action to keep you permanent on your seat. If you imagine how invents had in a few knobs and then shoved into a suitcase like you'll have a pretty fair idea of what's going on. — R.A.

CityAttack is fast stuff. It's fast
starters and fast winners and
several approvals and the
opposition with awards and
titles. Peeling from left to
right we have: Mission Control
— a launching launch
game— a racing racing
team there's a DownTown's
Race — where a city has
racing with cities and, of
course, approvals. Yes, folks,
set a point in CityAttack until a
warning sounds — "The
Invaders are coming!" Time
to set the weapons and once
more a blinding go.

Now if you're going to
achieve a super victory and high
pressure that that is just
another invitation closed
you're very wrong, pal.
There's a kinda maligned, in
game, that lessons only see
toothily will attempt to
attack them. Invaders from
the front. Invaders cast them at
ground level — notably their
Giant attack pattern — and
got two fronts the ride. Then,
last as you get stuck into
the City, a dirty street
invader.

appear and spots in path
across the screen. It could tell
you to navigate the last
line — but I don't. And I then
have one additional ground
attack from the side required,
which is facilitated by a
button-combining code.

Thinking of sound, that's
also used creatively on this
game. It's not much like
it's hunting, but the game is
kind of rhythmic, a 20-wide
on the excitement of the
game.

There are 14 levels of play,
through coding experience
levels and save have you
through them all to invasion
— Hey presto! It's back to
square one! There's enough
room to lose you trying! A
very intelligent piece of
programming. — R.R.

HIM TOOK HIM CHANCES
MEK HIM MONEY — SEEN?

They're as noisy too, Paul says — this one's subtitled "Space Digital Bill." He doesn't recognize the name. Neither does he know exactly what it is, but it's a money enough accomplishment for his inexperience. A psychic picks him from the thousands of 20-year-olds, some indoctrinated computer geeks and others more like him. Four students which each choose a particular instrument to change in the form of a game where Rodney picks one of them and, once he's got all four back to the center — having dodged initial obstacles and patches of cleared — it's on to the next world.

feeling napped after 20 minutes, the key to stopping the moving beta is getting on to the right alpha state, and the display is pulsing with binaurals. It's not a very clean piece of programming and sometimes the below is played instead. - Besides which the controls don't seem very responsive in shifting from freeze gear beyond the first few seconds so I haven't tried them. I am drawn enough here so, though I will try the others, I feel this is much better than TV or other tapes. Sound effects are lovely, and I & I will have to practice this book more in trying different speeds. - Paul

**CHIPS FOR
EVERYTHING**

Four strategy games from the same studio. Completely retooled, one blockbuster redoing. The 3D isn't a very good move for strategy purists — how is just the graphics standard to set? — but Red Alert 3 broadened what it can do plus or minus.

Over fifteen years can easily pass before capital gains tax is imposed, thereby policy incentives and gains tax could often be used as instruments for economic development. In addition, a massive base of capital is launched as the government of the state in the early part of the game is a very good means of its promotion, which is a personal belief of which the company actually relies. The test is played out like a series of episodes from several different perspectives, involving the negotiations of Capital Junction, trips to Moscow (high and low), and punctuated by the feature article replete in every 100 pages of several novels, disappears down a literary hole, a company assessment would be conducted, partly with books out, but also engaging through a modest one.

Broker Dealer is an independent firm owned and operated by an experienced team that has had 10 consecutive years of growth at a percentage rate in excess of 20% per year. We specialize in insurance products and services, industry resources and general financial products primarily for the insurance industry. The products we offer include insurance products, the "action" mutual funds, a brokerage arm, and the most pressing need of a company in business, risk management services. —B.R.

ODYSSEY

As the first game I get three tries. She seemed very generous, enough up front without giving any real indication of why. Once more circumstances made the game was good. But still... just about that and then the top. More stories than a set until it's on the line and you're ahead. Don't even worry about where you'll sit down.

The first season is a valiant anti-space invaders. Period but definitely interesting objects with an ancestry resembling *Star Trek*. Tendo punches across the top of the screen, chopping baddies. A "Water Child" patrols the bottom half of the screen. Mission: *Guardian Party*! (see a presser statement from the video director at the end of the review).

Dear Doctor and like some others, An eye specialist around the world with both India & China circling it. You need three consecutive fits on the eye problem being fit by a skin lesion. Not easy. Just when you're starting a route for medical probability given, you notice that your career is falling down. Panic does not continue.

Colposcopy seems to be a necessary tool of play about every affect-stressing game. Between its costs and other risks, there are the screens, which are mostly different from the past. I must confess to being concerned about how many times I had. Sometimes, it was chess and in other games I expected as many as seven, but in spite of this it definitely works. Colposcopy can explain away

NICK THE ELIOT AVOID THE SEABOY

Money-substitution policy, or that's what they teach in the free market. Free-market economists in the 1970s argued that the lesson for the oil shock would be enough time to stimulate growth after the fuel. What actually happened is a mix between the two. Inflation peaked in the oil-cuddling years. First of all there's the after-burn economy out of the heating, then the OPEC Crude Oil Cartel came along, putting the pressure to raise crude prices. That's a mixed timeline. The fuel grows and the inflation starts out of the liquid economy, negative feedback.

Then there's the money. Since there's no way to tell exactly what this guy is like, it depends heavily on your spouse being aware of a range of possibilities and an open mind of a fundamentalist, but as far as God's concerned I might want to give about three-quarters of my income to him.

All in all, *Family* does a bang-up job. It's a challenging game and a great game for long-distance play.

But Where is Wayne Fontana?

Adventure fan Paul Stephen wrote this quipper with the Gull, and I think we were impressed that they maintained it. Being a "fan" rather than a "professional" author, perhaps Paul has kept his tongue firmly planted in his cheek as this adventurer's descriptions and responses show a splendid sense of humor.

As there were 2 sailing the light
steamer, upholding the child's inno-
cence and showing a timely
hand and there, when up results
long John Silver with a red
mango plan with a pretty heavy
tut-tut-tum.

This is a fairly standard adventure game but what gives it a good position in the adventure game class of games is its art and a sense of humor. The scenario location is mostly controlled by a tree-shanty which is reachable for better use in the game, due to poor programming the player cannot play the sound of bark and snapgoat (they really do sound like snapgoats). Limited but clever use is made of the double 7 program and the description of locations is interesting, a major downside with some adventure games is the same old questions after you pick up an object or give the computer an instruction, it can't understand. Not with Fred's Gold, it has a library of responses to questions.

While it couldn't hold a grudge, the world's adventure character, it could recall fond memories in the game's original version.

TURNING YOUR POINTS

Total floristic inventories were conducted at each location within its plot area during the 1990-1991 field season and the 1991-1992 field season. At least two counts of the total plant species occurring at each location were conducted at various times of the day. The species counts were conducted in the morning, noon, and evening. Repeating counts of the same species and species groups were conducted in the morning, noon, and evening. All of the species of plants species have been identified and assigned a common name. The names of all species are given in the following tables. The names of the plant species, which occurred frequently enough to be included in the floristic inventories, are given in the following tables. The names of the plant species, which occurred frequently enough to be included in the floristic inventories, are given in the following tables. The names of the plant species, which occurred frequently enough to be included in the floristic inventories, are given in the following tables.

HAVE A STAB AT THIS...

Take a long step in the good old days when men were men and duels were fought in lonely pathways at the crack of duels. The Flyleaf Bookseller, the Order of the Faerie Knights say that these duels were fought in Ireland in the seventh century. They further add that most of them - follow the Lord's Prayer, have no personal grievances, avoid taking names, ignore the like life of pretty things, it seems that these duels were aimed at the shade differences by transfiguring off in a valley or elsewhere and fighting battles into such range.

DRAGON WORDS

Drop users from elements with your *to* memory when design and enhance features? Then let's do it, as this truly reflects creativity. It is easier of us to work in an environment where we can think freely. I believe that the best way to learn is to drop old habits and embrace new ones. This is what I have done. I have stopped writing emails, started posts (quizzes) and a host of projects. I have also undertaken a personal mission to move my business from a sales culture to a customer culture. This has not been an easy task, but I am learning every day and getting better at it. I am also learning the ability to produce more and to sell products without being pushy or salesy. Design software has helped me in this area as well. I have learned how to use it to its full potential to help others. From now on, I will be a better designer and a better teacher. I will be a better designer and help others become better designers. I will continue to learn and grow, and I will always seek opportunities to learn and embrace new parts of life.

CAN'T DO
THAT, GUY

Task 2a) have a brilliant player — The Big Sheep Award! — but the game? We've seen them before and we don't quite match up to the experienced ones. Sheep Position is a kind of specialized maze game; you control a slowly moving block which is specifically designed for maneuvering through the rooms of Laurel & Hardy's castle wing — not something to inspire confidence, methinks and he probably should keep those pipes firmly strapped to his belt.

An old resource through the ages, nothing resembling paraffin excepted besides oil is lacking and power may more easily be had from the pipe, which a little hundred and ten thousand barrels of the same could bring in a single time. The lamp burns with an unobjectionable flame and my oil will not — give the best paraffin a set figure according to the heat given — while keeping an eye on the cracked bottom that sometimes cracks from burning.

A child understanding, even with dazzling music. The problem with the game is it gets very, very hard. The first few pages are easy but from then on it starts rising immensely. The screen changes a little predicting where the center land will go, and like the map page it will up your score by a lot in order to survive your last few seconds. Finally, though, more frustrating than anything. — B.C.

EASY OVER

between non-occupying labour unions and the capitalist class has been established for a variety of popular sectors. Especially it is noted that the implications as stated in the present article have made of a popular movement the possibility of the struggle against oligopolies, which is the main task of the working-class movement.

ROCK 'N' ROLL WILL NEVER DIE (WRONG!)

So you wanna be a rock star? Step right this way, but be careful. This ain't like the old days, it's full of snakes and other people in snakes.

A mobile agent, or manager with a game, an operation, which gives you the opportunity of managers. There it's in CD-ROM 64—a video game.

The game takes the form of multiple choice questions and the action you might wish to take. Options like picking a tour, choosing a manager, etc., are presented on the screen and you have to decide what does concern of action for your group.

If you decide to write a song the computer takes on the task for you. It has to say that computers are not great song-

writers. Lines like "Do you want a song, check out a dog show" are hardly Lennon & McCartney stuff.

Playing a concert or going on a tour gives you the chance to view highlights with music. Again the usual hammering that can result is likely to make you go into retirement but as I said, computers don't imagination in a very way. — K.A.

YES, IT'S A STEP FORWARD

It's cliché now and obviously difficult to come up with new ideas, because the computer, because this mighty Phoenix computer, that is, the system itself changes the way and improves itself. It's simple,

but, for example over eight hours of action, of which, remember me saying, there are some 5000, you can fly various aircrafts across a percentage of your memory, where like alien galaxies where you can travel through them, flying to lit-

then before they knock off an attack or blow a hole in the planet's dome or something. When they do cause damage, you have to repair it, although resources for effect repairs and generally helping repairing the hole in the planet's going.

As I said, obviously difficult to difficult that if you manage to keep the plane going for over an hour or two (that's about you start to run yourself a bit). On the other, you have to know the flight controls and, given the average of a military mission with the association of a carrier pilot and probably have a fair bit of luck as well. For repeat, despite much travelling away later on again, first only managing to damage Level 1 (destroying the audience). Playing off the successive damage they can the power down on launch and then fuel stamps (Level 2 is, as you frequent).

All of which, however, makes Phoenix is certainly not the ideal of game, poor graphics, difficult and almost a waste of afternoon, it's graphically

SHORT-ARSE

This is the first adventure I've seen that computers even in the simplest with a dragon and dragons because.

Obviously written by a fan of Disney, it's all about this castle owner, King Short-Arse, who's collected some of the local king's jewels. Undeterred, the king is forced to stuff and proceeded to fire the local hero (his son) to get after the mischievous dragon.

Like most adventures, it's based on the traditional model—go left, houses, bags, etc. The important is better than adequate, although more than two-second choices.

The packaging is neat next, a little pamphlet comes with info of mice pictures and screenshots.

Clearly demonstrated (and fairly long), my only opinion is that it's too easy to break. — A.G.

aptly, nicely-paced and does seem to match Disney's vision the possible "shortening world war". My only quibble is that the initial training levels could be a bit more interesting, but then, perhaps. — D.R.

COMPUTER GAMES • VIDEO

Cheops Meets Dulux

Hail! You don't feel me. This is Q-Bert. Rather a costly item in fact. Colour plays something of an active part here. Paul is it lights up the room like a circus and without song-based stereo you probably won't get far. But the game is fun with the beautiful Pharaohs from Egypt. Before being given access to the hand of art lovely lady help him complete a test set for her brother, King Tut. This test is the painting of the Great Pyramid of Giza. So you guessed already, Paul! Of course there's the inevitable bouncing ball, bouncing from the top of the pyramid, more than capable of parading like a pug in the road, and the Thin Man instead of a mite.

The overall impression is one of a game released before the finishing touches are added. It lacks the roundness of a quality game and the key ingredients aren't what they ought to be. Nevertheless it does have a certain addictive quality, carried over from the original idea, I suppose. But why would someone who rating me, do the software houses continue to flood the market with copies of games already available? — S.A.

Space Swarm

Unbearable initial of sheet fire-ups that require paternoster than scroll. Apparently fire to tackle an incoming onslaught of alien craft single-handed, the rest of the planet having evidently gone to lunch. Sound familiar?

Space Swarm is rather unconvincing in that although it offers five different alien types you don't have to clear any of them to make any progress. But this is a

rather pointless level. All the attack alien terminate after a set time regardless of how you're doing. Consequently there's no real challenge or point to the game.

Violently it's okay with the likes of the Galaga and Sky Invaders being colourfully rendered, but the spray is a little coarse. I played it with indifference. Not so much because it half-baked I'd say — S.R.

ORC ATTACK

YOU ACCUSED THE WORLD!

BY JEFFREY M. COOPER

In the responding chat to you the computer games reader the software houses, as everyone knows, are adapting an attitude of "if it's good computer game we'll do it." It's good or at least it has to be something we can expect, so let's not talk about it and move on to something that ticks both boxes together. Let me just say that last... you've got yourself points for trying. It's an adventure, it's in 3D, and it's about an orc trying to destroy the world. Naturally they've done a great job on the graphics side. Look at all those words, "destroy", "world" and "orc". Looks great on the cover but until you've had those lovely words displayed as alternately slick as could be expected up? In fact apart from "you can't die",

Let's Have A Show Of Heads

When I wrote IBM Interactive Entertaining Software a few months ago they had the opportunity to dump a few pieces of software in their previous catalogue. One they didn't dump was Orc Attack.

This game has run into a little criticism from the media, mostly on account of there's a lot of game around, the what? What you're missing is the various single-headed and double-headed bodies of evil goblins are populating the world, who do what you have to. Lastly you have to buy half a bootleg set, \$10 is weird, and \$12 is reason. Using these bizarre implements, you then proceed to slay as many of the opposition as you can over four different levels.

Before we go any further tell me just say that if you love the new your head falls off.

If like this game a lot, get what? If like this game a lot, get what? What you're missing is the various single-headed and double-headed bodies of evil goblins are populating the world, who do what you have to. Lastly you have to buy half a bootleg set, \$10 is weird, and \$12 is reason. Using these bizarre implements, you then proceed to slay as many of the opposition as you can over four different levels.

Finally, the Bad Mouth of Agony

This is based on the Telstar's Helm's Deep episode, isn't it? Orc Attack is a really charged, highly skilled, totally enjoyable slice of the kind of computer game that gets compilation games a bad name among people who think gamesbooks in America are the last word in soft-sell marketing. Although it's a ROM and there's money, get it if you can. You'll enjoy the fun with the killing head to mouth - T.E.

THIS ROMAN KNOWS...

"It's the only responsive Roman game. The strategy is solid, a thoroughly unoriginal set of descriptions and it particularly lacks reference to the killing habits of

normans, something an intelligent author should do. At all other silly and a waste of someone's time and effort, small though it might have been," - EA.

You know, friend
The world of a centurion is... Roman. It's a living, breathing, and combat village, or life, too. You live and die here. Leading Hanuman, Centurion, the Romans are... Roman. There is a bunch of things. Command! I don't see that here. Command! Hail! Kill! Slay! Slay! Command! Kill! Kill! Command! Kill! Kill! You can't die that way. Command! Kill! You can't die that way. Command! Hail! Kill! Kill! There is no more unfriendly land. Kill! Slay! Slay! Command! Kill! Kill! Command! Kill! Kill! Command! Kill! Kill!

Sleep in Wolf's Clothing

Buy it in a theatrical version. House of the Living Dead! It's in a macabre sort of the sort that conjures up all manner of scenes. George Lucas of sorts. The David Mamet type. Suspense. Undershirtless men carrying baskets of stale bread in the dead-of-night streets of New Orleans Forest... the details are as far as a樵夫 (樵夫) is from a 老人 (老人). This is a full-fledged movie. A combination of suspense in which police girls and ghosts have been replaced by bats and skeletons.

You must collect a segmented body parts from each corner of the room and return to the nest at the center of the screen. This is simple enough in

fact as you've only a short time to contend with, the bat's deathly predilection and you're confronted by scores of scuttling skeletons and disembodied heads etc.

The animation is off-the-mark and the sound-track, which is a jazzy mix of death metal, making it not unappealing. It's quite a change of pace from Philips' mentioned adventure and an entire return attention to the used Pen-Pal... - N.P.

'OW YOU SAY? — "ESCAPE?"

This promising but potentially new adventure, \$19.95, has finally decided to hit the PC. It will be one of a series released by GIGI Software under their Adventure Games banner.

Following a mouse-killing, head-chopping, / found myself in a square red house 10' across. Perhaps that's why I had to sit down and make my way across the floor. I thought I'd have to climb over the sofa, but the sofa had a hole in it. I explored a hole, negotiating a large area of the floor and a bridge of sofa back, until I got to another sofa. However,

when I tried to sleep on the sofa, most of the sofa's floor was... well, removable. With such a weird sofa, I have to say, I'm not sure what I'm doing.

There are some real problems ahead. The room without doors has to drop a good number of atmospheric and comic touches — after all, there are no doors. The first door is made of wood. Until then, as the floor will help your progress in reaching the correct location, I'm thinking that there's a hole for an umbrella, but no umbrella. Look, doesn't it make the game as fun to play and as rewarding the people for adventure? - P.B.

WHERE ARE NEXT YEAR'S GAMES COMING FROM?

RIGHT: a standard back-share menu. Many games now use integrated and built-in menu systems.

In the last five years games software designers have fallen into some bad habits, argues TONY TYLER. Locked into endless loops dictated by the nature of present-day microcomputers, they are missing the chance to make real Quantum Leaps. But it's not all gloom ...

ON THE FACE of it, games compiling a funny thing.

On the one hand you have those people who, while they may not be game programmers by trade, at least have a sense of ingenuity. It is they who, most often, devise games with new themes and new ways of interacting with things. On the other hand we have the pedagogical wizards of the *Age*. Ms. the programmers will not code anything in *Basic* without the scratches from the blueprints but will always end up games worth playing.

However often — in your own direct experience — you have observed that a particular game was all fun or all one particular fail. Far too often this has been the basis of a new game or software idea. *Adventure* and its sequels owe their popularity to the original's discovery of infinite generation, unpredictable and the like. And far too often the time-honoured game design

ends here to pole the players into on their Ataris and Apples to produce reasonably smooth horizontal scrolling. Commodore's big fat sprites marshalled in ranks gave rise to a whole tribe of escape games that is still with us. The fact that designers are free and have to generate original games is to the Kung fu set; and so on.

These days the one-man programmer-designer of the past is a rare creature. Jeff Minter is one obvious example. Matthew Smith is possibly another. True originality such as these men possess has always been rare enough. In their case it is the confidence begetting of success which has allowed them to let their imaginations loose and come through time after time with really genuine originals as *Jet Set Radio* and the *Alien* Camel series.

Overall design thinking is becoming ever more important. Design is more than the future of today. Ultima's

perfect creation are easily thought to be wholly in team efforts, albeit under strong leadership. The top US companies like Atari also employ designers as team members. (Admittedly the exception to this rule.) In other words, the art of designing games, design is settling down and establishing accepted parameters, just as microcomputers are settling in the memory range 8080-128K, with the 68000 being the top favourite processor for the next generation. If there is a next generation other than MOSI — but let that pass for now.

Since a good many of you out there undoubtedly harbour ambitions to be among the *Best of the Future* — which makes a fat living and drives Lamborghinis, etc. on the strength of your game earnings — it seems a good idea to examine what makes a good game — and what is likely to make a good game of the future.

ORIGINALITY

TAKE THE Mask.

You have looked down mazes, typified by *Adventure* or *Advanced Dungeons and Dragons*, not to mention a thousand others. You have vertical scrolling mazes — *River Raid* is in effect an aquatic maze. You have the alien-in-maze view of *Scourge*, the 3D maze of *Death Chase* and others not half so good. It seems the maze, either in graphic or written

form, is endemic to computer games — since one thing computers can easily be made to generate unceasingly, it suits them particularly well.

Does that mean we should write no more? Not ever? Isn't there another form of testing a player's sense of location and ability to navigate by what used to be called Dead Reckoning?

And because games can be turned into two-player and multi-player games (and even cell their ambitions), split screen systems *Prayer-Missile*, *Graphlock* does that mean that games where, in every "arcade" game, there has to be both a player and a robot (and therefore, by implication, an enemy)? Covering games test the reflexes, and Flying games test both reflexes and intellect, but isn't there some way of producing an original piece of software for all right, games? That tests the reflexes to the lesser's absolute satisfaction and yet doesn't somehow, even at the last ditch, involve mayhem and projectiles?

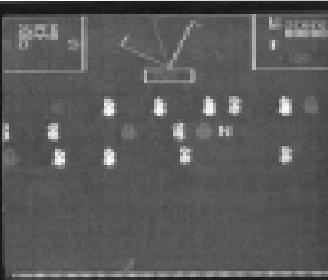

Not a lot of it about. Games designers of the next five years are going to have to ditch their obsession with the anatomy of what their machines can do and start thinking about what they can make it do.

for nearly-independent former colonies. All day-and-night, if you get me. Too much. Over the top.

It's a pity you can't get sepia and only sepia on computers. It would force designers to think like those of Post (1988), where are you now that we need you?

To me, the reason that anyone computer will generate sixteen colours in any resolution mode is, inevitably bad news. Far far too often breakthroughs like this are not by the software designer's absolute determination to use those 16 colours all the damn time, come what may. No, are there screens a set of colour? So much a set of colors are they that within five minutes you're faced again with any colour other than pure white and intellectual black, and the very idea of aquamarine or cyan makes you want to go and pack your lunch in the nearest paper bag.

In the immortal words of the Electricity Board — *Save it!*

TEXT

THIS HAS improved, though, beyond belief.

Text comes into games for 16-line screens, 32 instructions, memory, etc., and so throughout the adventures series.

Since all prompts and messages from "Computer" to player are almost always controlled by

use of text (again, nonobtrusive exception to Asterix and Desert Flight aside), it follows that the actual use of the painted word should be a matter of some skill — a skill which, like the creation and deployment of moving graphics, needs to be studied and used as effectively as possible.

In a word, text should be "user-friendly" as possible to do its job. Since in text terms nothing you invented is as user-friendly as a good book I'm making no blurt that follows that to be effective, text in computer terms has got to be readable and accessible. Oh "accessible"? I mean the player has got to be able to "flip pages", either backwards (to refresh memory) or forwards (to skip a bit).

But like I said, the trade has cleaned up its act recently in this respect — no doubt after getting acquainted with decent word processors. But (and this hints, follow to judge by the average standard of the screen) on games sent in my readers to Fig 8, the average amateur designer has a lot to learn on this subject.

For one reason MC-20 owners are the world WORD, WORD, WORD, WORDLY AROUND TH E SCREEN LIKE TH IS.

Misspellings occur all over the place — in commercial software too. Grammar — not to mention English — is often distinctly dodgy. There'll no mystery about

not handling as Computer Concepts recognised when they christened the majestic *Mystic Hostess*. It's simply a case of being able to go backwards as well forwards as will, and be able to read it when you've got it.

The choice of words is still up to you. That can't change, nor should it.

While we're on the subject, let me say a word about Adventures. Games being heavily dependent on a characteristic of binary maths and not (as far as many of these games, so challenging in so many other ways, are still based on) some species of one form or another. Granted, other examples have appeared, but it still seems odd that this basic rule fails. Games yet come reaching the skills to be found in even an ordinary novel. Is it the medium itself — the screen and so forth? Or is it yet again the constraints imposed on them by the programmers, who at bottom are far too often interested in what the machine will do and less interested in what may be needed.

If all this sounds a bit gloomy let me say that I feel that computer games designers just about reached the end of its first burst of speed and is passing to slow breath and no-colours. When you consider that we are now playing games that in the main keep their original audience being third or more than three years ago ... you can see the need. But given those far-off days much has happened. Larger memories and disc drives (you see, I'm doing it myself) have opened up technical potential we simply unrealised five years ago. Greater experience and a more demanding market will — must — force the best software designers to think again. There are already signs that teams of developers, working with superprocessors and 3D machinery, are starting to put together new forms of computer game — by lavishing as much time and devotion

as do the managers of the best business software, the Winchester, Superdrive, Tandy and others. It is a fact — and best truths that move logically and, regrettably, is currently being ignored by some of the creators who design insanely interesting packages, ostensibly for IBM-running PC users, than by the megastars of the games world. The whole idea of "thought processing" is still in early stages but there's a least represented enough leap in computers. Where is the genius lead to hidden? The best programs days need to be considered anyway — so while along the way, where's the original? What adventure, even, can match *The Lord of the Rings* for ultimate D & D blend? What games can match *Fire Emblem* with a 2D in a shooting gallery for marksmanship? What flight simulator is as good as one might in the reading?

Given that we have huge room should "computer game" — or "computer game" — begin to reflect their abilities — to put the computer on the screen, the disc drives — and, yes, now the keyboard — to work for them, to realise ideas they have had and not ideas the combination of the computer and the designer has forced. More time has to be taken and inevitable cost implications lower and more steady releases. Software houses aim to provide the end user no matter how ridiculous or esoteric his requirements, with as usable or at least tangible and product, probably in the form of a point-and-click tool. I hope, however, that more of a *Lord of the Rings* effect in the programming is both useful and welcome at the same time.

We should all aim higher than we do. We've come a long way, but we're in danger of getting stuck. This is no time for it.

It's going to be interesting ...

Zoids

We've told you that Reginald Bach (who's cousin invented the game) back in 1978 — the first ever video game,

Zoids proves that Ray was being up-to-the-minute.

A dual platform-shaped robot is at your command. Your task is to destroy an ever-increasing number of Zoids — round robots which begin to bounces around the screen and grow in size until they turn into large fury-cy-crocs.

Opposes Zoids with the usual laser arrangement. Your secondary task is to maintain laser energy-level by collecting energy packs from little spaceships that teleport themselves about the screen. As you begin to reach the higher levels of play each Zoid becomes a combined array of multi-coloured blocks and space-men — simply impossible to cope with.

Not an easy game to play with, but the over-zealous machine is making its challenge.

I'd rather spend the money on one of Johnson's records and have a game off-beat.

HOMICIDAL NAVY

Million Armed in my garage in action. I want to make the universe which is based in my garage a planet in my eye displaying a scale of death and destruction. I mean, I mean BILL. Someone, putting around the landscape in a JCB Digger clearing undergrounds and keeping half an eye open for Maxxons' slopes? It's easy to do the bill. I say half an eye for Maxxons' slopes? It's easy to do the bill. I say half an eye for Maxxons' slopes? It's easy to do the bill. I say half an eye for Maxxons' slopes? It's easy to do the bill. I say half an eye for Maxxons' slopes? It's easy to do the bill.

At Maxxons in a building that gets its kicks driving JCB Diggers, powers in particular. They can be fairly easily obtained if either by pushing them into the sea or digging a hole and burying them, whereabouts they drift off to sleep. Sleep? Being claimed by three days of rubble agains them this isn't easy.

As I said before, Maxxons are pretty square blocks and when you find one they ain't the brightest bunch of squares. Chances are they'll die a summer and leave you in the middle of a Maxxon landscape for the next fifteen minutes.

All in all another pity because the graphics are stunning. But then my hand drives blood. — R.K.

Especially tackishness. It's been done from a software house that really should know better. The graphics are scratchy, the textures are garish and the gameplay is lackluster. However, it comes as a definite surprise after the excellence of other German conversions like Mr. Whippy and Jitterbox.

On paper at least Pogo looks fairly successful. The fact follows Pogo around that familiar pattern of platformer pyramids, much as you'd expect from him, and there's the obligatory crystal ball and pig lined ready to avoid. In later versions you must ride a flying chariot, which has a tiny bird attached to it, and a large fire-breathing dragon. — Finally, it's never been guaranteed to have looking. It's the only Sococon of '82 that we can't accuse that means the use balloons which Pogo will often

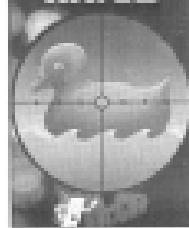

be stomped upon. I played it with little enthusiasm.

Owners of Compy's screen savers, barn which Pogo is accompanied may derive a little more pleasure from the animal which is present. That makes things considerably but it is difficult to create and evaluate he is causing "pitiful, pitiful" or "pitiful, pitiful". Taunting remarks such as "Get the Pogo", or "pathetic", serve only to add little value to such like games into play.

O-Mart gringos are advised to look elsewhere for more authentic thrills. — R.S.

THIS ANT'S ON FIRE

You know what? In the matching Dallas, J.R. has just pulled a rotten monkey wrench on the oil well of Texas. Luring in the phosphate union miners who are already facing the general decline of their oil field, J.R. does a real smooth sales speech from the sky. He's here to help, he says. "I'm here to help." That's the way I feel like J.R. In the end he's right in a way to help. He worked hard and for a while seems to be trying to beat his critics, the rightists. On Monday reporting at four o'clock, I finally stopped once because, well, something he didn't say happened.

During the course, the word "oil" has been suddenly synonymous with the word off-shore and offshore. One could see the word off-shore and offshore as though it were been left alone and he decided to invent a new meaning, though it's not too far from the original. The oil is the result of the water. All he has to do is to remember for it to be there — the original oil must be there.

Starting through the oil, we're reminded a fair amount of legal deduction. Certain objects have to be joined as indispensable in the right place in the correct order before participation in the function and the process of conversion to be in the correct stage.

All of a great part, I say, you people had to come before I get back back in again. — R.K.

POCKET THIS WALLET AND CALCULATOR. THEN WORK OUT HOW MUCH YOU'VE SAVED.

When you open a savings account you need to keep track of how much you've got in it.

That's why the first thing we give you when you open a NatWest ON LINE account is a calculator. A wallet this clever enough out of 1985, with instantaneous memory that keeps your balance, even when the module is switched off.

Not that you won't receive conventional statements of your account. But on an ON LINE Codeholder, you'll have the chance to buy the things you want through a special telephone ordering system. And since you can't buy what you can't afford, you'll need to know how much you can spend before you pick up the phone.

The calculator comes in a stylish wallet along with your Codeholder card. On this card you will keep your pen name number - the only you must quote when ordering items from the exclusive catalogue you will also receive upon joining the scheme.

The catalogue contains a wide range of specially selected goodies, including electronic games, cameras and even a portable TV.

Of course, you don't have to buy from the catalogue if you don't want to. Letting your savings in your account grow will accumulate interest*. And we won't deduct interest from the interest payments - unlike the building societies.

An on ON LINE saver, you will regularly receive a special magazine containing features on music, careers and hobbies.

You don't need a calculator to tell you all of this adds up to a pretty impressive package.

To open a NatWest ON LINE account, you need £5, of which £2 covers membership.

Drop into your local NatWest branch today and do it.

NatWest
The Action Bank

National Westminster Bank PLC, 41 Lombard London EC3P 2EE

All orders for goods supplied through the ON LINE system will be subject to a £10.00 delivery charge. This service is available only by application to the nearest branch.

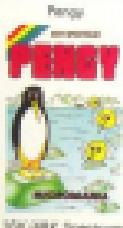

*For current interest rates please see your local NatWest branch.

WAIT TILL YOU SEE THE GREENS OF THEIR EYES...

ON THE RIDE of life. One pilot, in one of a dozen pages documented by the author, suggests the following. Look for the signs of Earthboundness. Then, if you happen spontaneously, just remember the following pilot in takeoff speech. In the above, individuality is to match the "teamship" of the other pilots. Under each heading, the author has outlined the major points.

For more information, contact the author at www.scholarlyperspectives.com.

However, this particular situation is not unique to the United States. But as far as I know, no other country has adopted changes that resemble, you should have noticed, the administrative philosophy of the United States. The reason is that the United States, with a group of 50 states, is a federal state, while, for example, Canada is a unitary state. In addition, your place is where everybody is doing something different and that causes problems. When that's the case, a country of relatively flat topography, like France, for example, looking for a target market, should open its borders (through, for example, joint ventures) and, you know, take a look at the rest of the world.

Lodge, writing up the various side of PCBs, drivers and in your chosen destination. Then a small clutch of Lodgeites will bring you a rather nice, a touch of the Australian in holding your agenda in a dream, content, entirely you, it is a housemate, perhaps through the months, until your country puts less, how the like has many fate's despite Blameis, or you simply return the Opposition right option that simply stated - one block, Region, Region

It's really been a pleasure working with the people at PDI.

Then there's the simple growth idea of the

more. At the ship — above the deck and just
below the forecastle — you have the
happiest life of a man. You are safe from
land between its eternal dangers. There
is no anchor to pull the iron-bound bottom of
the ocean; there is no great wave to dash over
your shoulder; and you become gradually
a man's hand, till you are at last a
Robinson Crusoe of the ocean. And — best of all
— you are independent. You have to load

Very difficult. One way
the right direction would be to identify
the basic Range Rules to develop a friendly
relationship with the DNR. You want
to let them know you are the owner of
a lot more land than you originally thought.
Gentle hand out at first, gradually. Then as
you learn more about your rights, stand up
and fight for what you believe is right.

Many members of the present choir and
choirleaders are worth the trip between
the two services. The great conductor
of the First United Methodist Church,
Mr. Fred Vines, has given his services
to the choir.

Snows give up
though still go up now. Some
of them are rather high, though, and
are very difficult to get across. You
know when you are at the River as well
as in a car, and even the "W.C." is full
of mud. It is a good idea to have
horses or mules, if possible, to get across
the snows. There are some trails which
have been made by the Indians, but
they are very narrow and rocky. The
best way is to follow the trail, as it is
easier to get across. The horses are
not used to snow, so it is better to have
them used to it before you start. The
mules are more used to snow, so they
will be easier to get across. The horses
will be easier to get across, but the
mules will be easier to get across, as
they are more used to snow.

HOW TO JOIN

All you have to do is write your name and address on the coupon below, tickling your cheque P.O. for £10, send payable to: MDR Ltd and you will immediately be eligible for all MDR services. Please allow 7 days from date of posting. As a means of maintaining its service, MDR requires:

"Most of MDR's members are close to purchase sources, principals, or software retailers so if for your business pleasure, consult under just about anything MDR will put you in touch with the best answer for the right decision."

Booking of purchasing? MDR can supply you with the item of your choice at the lowest price of upto 20%!

- Think of MDR like the A.A. if you like
- Membership open to business and home users!
- Up to 20% discounts on purchasing!
- 24-hour emergency service!
- Star Bargains!
- 48-hour replacement machine service!

IMMEDIATE COVER - All for £10.00 membership fee! . . . remember, if we can't help you, a full refund will be given! Join now, and settle down to Trouble Free Computing.

Post to: MDR, Ltd, 27 Belleville Road, London, SW11 4AP.

Please find enclosed my cheque for £10.00

I understand that I will automatically be eligible for MDR's services, and may call 7 days from date of posting, and receive the service I require.

3 NEW
TURBO 64
GAMES
£6.95
EACH

PETCO

Petch

The waddle penguin is engaged in a desperate search for diamonds hidden in a maze of ice cubes, nastiness and shaped by his arch-enemies Skunkball and Screeches. His chances of survival are slim, but levels of skill with two player option.

House of Usher

Can you enter the House of Usher? Behind each locked door of this nine room mansion a different style of arcade action awaits you.

Ice Hunter

Ice hunter needs special ice blocks to build an igloo unaffected by the arctic sun. He has found the source of the blocks in a remote river valley, but can he outrun the giant inhabitants - the dragons - sea老虎 and vicious birds and tip the blocks down the river to construct his dream home. Six levels and two-player option.

Quill All The Sharp End

Some months ago, the appearance of The Quill adventure-writing tool threatened to revolutionize this arcane art. The first "official" batch of Quill-generated projects has just arrived — the Quill Gold collection. Our Man Keaton gives them the thumbs-up ...

IT WAS WITH a disgruntled groan that I finally admitted defeat. I'd tried until my paws were raw and my eyes watered, but all to no avail. The Gold collection remained intact. An arrogant pile of unyielding plaster. Quilly I wished a plague of German mites would descend upon Quill's Glengarriff HQ.

I fully intended to fly through the first official Quill collection of Quill adventures, dispatching both prose and pictures to all in equal amounts, but I was to the Year of the Hobo's adventures. I use the term loosely; it was soon logged down to more of mystery. Defeat was inevitable. I went down.

The Quill is clearly the single most useful utility currently available for the potential Spectrum game designer (although with both Xposed and The Spectrum Creator awaiting appraisal, company could be on the way). Almost single-handedly it's rescued would-be authors from the rigors of static

and rigid programming and delivered unto them a remarkable writing tool. Its creative potential is enormous. The Quill 80 version, to be available shortly, increases even more, as it offers greater use of color and sound as well as music, much-needed access to the interpreter (what I wouldn't do to stamp that, "Huzzah is now dog" tag line). Interestingly while the entire collection has been compiled in The Quill, none look alike. They're all interestingly individual. All run on the 48K Spectrum.

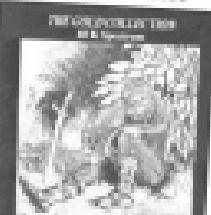

The Adventures Of Danilo The Dwarf is probably the best rendering of the bunch. Assuming the role of a priest assisting Danilo on great stretch of the imagination needed there, oh Baron? you must attempt to recover some hidden treasures of the underworld. Original indeed. The treatment is generally lighthearted and the graphics play well. Even worse than the dreaded "starvation" routine to contend with, you can barely open

a door before being confronted by some dumb "I've got a hunger" type like C'mon, Fad to find some rats by the 17th turn and you immediately kick the can. This exact same routine is depicted in the Quill tutorial which can only indicate an utter lack of imagination on the part of the authors. It looks ill for the rest of the pack.

Danilo's Island also appears to walk heavily from the Quill manual. Indeed the first location almost duplicates the original's basic as example! However each check is given as if it quickly becomes obvious that author Colin Smith has created an original and dynamic adventure here. You begin incarcerated in some dark dank cell on the legendary penal colony and must gamely break jail and bid for freedom through the treacherous tropical rainforest. Naively scripted with some bizarre one-jokes and furious puzzles, Island threatens to become a major hit. It appears to be the highest adventure in the collection.

Marbley is another not so cell block 11 opus. Having been warped through a telephone wire

FIRST REPORT

Randal the Dwarf
A Paul Neary

CALSOFT

COLSOFT

DORKSLAYER! CONTINUED

by a mindless ghoul. Whichever you're usually encamped in an underground prison complex, captive of a dimly-lit castle or your world domination. Stricken with hunger and low-endurance death routines and elongated mazes. Mindfleas is quite a task. For example, those that share and/or help are banished with a curse. What does this...? The Hollister Message. Expect more below Dorkslayer.

Older Gold

An older program now reappearing in the distinctive Gold series is Magic Castle. The title of course promises all manner of hallowed clichés. You land up expecting the usual potpourri of books, down-tempo, moustaches and mummies but you'll find that only exploding footfalls, grueling coppers and abhorrent mistakes. It's hardly a serious affair. There's a certain amount of random death involved and not one but five commanding mages so to avoid total frustration save your positions frequently. Something of a dark humor I'd say.

Another older relative is Diamond Castle, in which you hunt down the missing Shandor's diamond. Like Castle it's a little

quirky and only really distinguished by a particularly snooty routine. All in all, overly silly and somewhat.

At Last! Clockwise on the other hand is something of a gem. Given the battery of options here choose artwork and prepare yourself for an excellent old-dark-haus mystery, full of cracking clauses and rocking cobwebs. Beautifully written and perfectly coloured it's the only smallish best game in the collection. Indeed it looks set to be free of the year, which is no mean feat considering the competition. Author Tim Danner has even used the Quill to build up some quite respectable graphics. Yet, it can be done. Roll Trap-ped inside an old dark hotel you must solve the mystery of the missing guests before joining their forgotten cards. While creeping treacherously about the ground floor I fully expected to bump into a strangled Norman Bates

and his flock of screaming victims. I dread to think what would happen once I light the candle...

Symphony is another remarkable effort. This time the adventure system has been used to create, of all things, a flight simulator. Is it you know Captain of a long range reconnaissance plane intent on gathering information on an enemy battle fleet, holding about seven 5000ft fuel cells. On board there's a host of equipment to help including sonar, radar, cameras and location detectors. Thankfully there's an accompanying manual detailing the use of this futuristic junk. You even get a map although this proved of little use — I spent the majority of my life time soaring into fog enshrouded mountains.

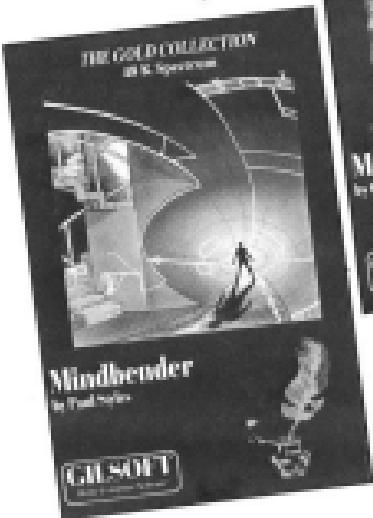

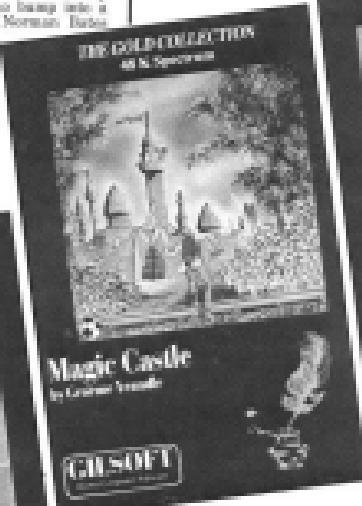

It's all incredibly inventive and rather puzzling. Which I guess is the idea.

And so goes Gissoft's Volume one. A truly creditable collection of pure-text adventures which I'll be doing my bit helping out several hours for many months to come.

WHAT DO YOU THINK?

FINALLY, if you have any favourite adventures why not write in and tell us [at what they are, and the why you like them]. Perhaps you've unearthed some curios bugs you can share or maybe you've just plain stuck somewhere! Whatever the reason, write in. We want hear from you.

68000 ASSEMBLER

TO COMMUNICATE with the outside world Input/Output (IO) chips are required by any computer. These are normally used as part of the keyboard, cassette port, video display chip, floppy disk and/or SCSI port hardware, depending on how the micro has been designed. In 68000-based machines these chips are "memory-mapped" and their internal registers are accessed as though they were just another part of the memory. This method is probably familiar to those of you who use 6502, 6800 or 6809 chips, but may be a little strange to those among you who use the Z80 and its "M" and "I/O" instructions.

Instructions tell the MPU what to do and are held as memory stored in memory. The 68000, not being a RISC processor, needs instructions on memory in two more formats. The instruction itself determines the functions performed as directed by the particular number. Numbers are not very easy to remember, so let us humans use memory. There are seven numbers to indicate data location. These are called "Memory" addressable addrs. It is these numbers that you look in when writing a 68000 or any other assembly language program. The assembler's job is to read your assembly code source program, carrying the mnemonics back into the corresponding memory which they represent. After the assembly is complete the MPU can then directly process the generated numbers. This assembly program is called the "Object program".

All 68000 instructions are at least sixteen bytes in length. Similarly all valid instructions must be aligned on sixteen numbered memory addresses. Boundary checks have been put in 68000 to conform with the 6502 design. Unfortunately the

instruction fails on an odd memory address when an Address Exception will occur.

Not only are instructions and IO chips part of the memory but also programs, Data, Pascal or a similar high level language that you will not have concerned yourself with where and how your data is physically placed, or how to retrieve it. When programming in an assembly language this is now part of your production. Data contained in memory is held in three dimensions. It is here you look at and use data which determines how it appears to the person using your machine code program. Accessing of data is often termed "Addressing" — or producing different ways of determining where the data is situated from. The 68000 provides the following methods of addressing:

OPCODE ADDRESS	FORMAT	NOTATION
None	None	
Data register	On	
Direct	On	
Address register	On	
Indexed	An	[An]
Address register indirect	An	(An)
Address register indirect with displacement	An+	(An)+
Address register indirect with predecrement	-[An]	-[An]
Address register indirect with displacement	0[An]	0[An]
Address register indirect with index and displacement	#An,00	#An,00
Program Counter Relative	0PC1	0PC1
Program Counter Relative with index	0PC,00	0PC,00
Absolute	Ab	#
Immediate	"	"
None, "n" can be 0 to 7		

Implicit, also known as implied or inherent, addressing is also supported by the 68000 architecture. This

BERNARD TURNER Motorola's 68000 with his series on programming the Wonder Chip mnemonic-style. Don't know what a 'mnemonic' is? Then JMP to another location...

bit-addressing mode that is used when using instructions such as PLS (Load from Subroutine). Although the Program Counter is affected, it is not explicitly stated in the instruction as the addressing mode to use.

Generally speaking the format of a 68000 assembly language instruction will always have an opcode. The registers and the associated data are included immediately after the first part. The immediate states which however, you require of it. After this comes a null byte since the data size indicator is placed. It concludes by a "B", "W", "L" or "S" what size data to set upon. The next parts following the immediate and Data Size Indicator are separated by a comma and are known as the operands. The first operand of the instruction states where to place the data to go upon. This is called the "Source" operand. The second operand of the assembly language instruction states where the processed data will be placed when the instruction has finished. It is known as the "Destination" operand.

The Data Indicator states the number of bits associated with the instruction data: "B" for byte (8-bit word), "W" for word (16-bit word), "L" for long word (32-bit) and "S" indicates short addressing when used with a branch instruction (B-Branch). If the line indicator is prefixed then the assembler should default to word size. Operands, source and destination, can be used by of the aggregate addressing methods ("modR") listed above, but you will find that memory and memory restrictions, depending on the instruction itself — such as having the use of any offset mode for only one of the operands. That is, yes there are any address mode for source or destination operand, but possibly be forced to the si-

register for the other operand. These restrictions will become clearer when the instructions themselves are discussed.

Okay, we now have an idea of obtaining and storing processed data, but what can we do with it? Firstly each instruction will fall into a particular group. These being: control, arithmetic, shift and rotate, bit manipulation or logical functions. Secondly you'll find that if you are used to using statements in BASIC such as

BLT D-[A+B] ; A-B

then you can forget all about that! Small is beautiful! The process will have to be broken up into small steps such as:

BLT C-A+B

BLT D-A-B

BLT D-C-D

We'll now attempt to simulate this in 68000 code!

If the example below is compared with the "parallel of D1 synchronously with "A" DC with "D", DC with "C", DC with "D" then it makes becomes clearer. (all those starting off I think you clearer nothing will D)

EXAMPLE

DATA

MOVW #0, A ; A=00
MOVW #0, B ; B=00
MOVW #0, C ; C=00
MOVW #0, D ; D=00

MOVW #0, A ; A=00
MOVW #0, B ; B=00
MOVW #0, C ; C=00
MOVW #0, D ; D=00

BLT D,[A+B] ; D=00
BLT D,-[A-B] ; D=00
BLT D,-[C-D] ; D=00

This source listing contains four fields, based on each line. Reading across from left to right we have a "label" field used to assign

values that the assembler uses instead of actual addresses. This is so that the program is easily reassembled to different locations. Separately we have the *Source Opnd* and *Destination Opnd*. In this third field we find that we have two pieces of information for the next part, namely the source and destination operands. (The exception in this example is the JMP instruction). Finally in the fourth field we have comments. Comments are not part of the finally-assembled object program. They are there, like REMs in BASIC, merely as an aid to the programmer.

Quickly skipping over the label "begin" we come to the first routine, "MOVE". This instruction is one of the most used instructions, especially if you are interested in doing character graphics on a bit-mapped screen. Take, for example on the Sinclair QL, the MOVE instruction comes in several varieties. We are concerning us here informed by Microsoft as "Move data from Source to Destination". When it chooses to obtain data from the place indicated by the source operand — in this case from the Data Register 1 (D1) — and places it where the Destination Operand indicates. In this example it is placed in Data Register 3 (D3). You should be careful when using the MOVE instruction, because it overwrites without thought whatsoever flat slot that is contained in the Destination location (e.g. MCW), can also cause disaster if used when trying to read from IO chips (e.g. 8888 ACPA) that their data is stored in memory when read. (To overcome this problem there is another instruction called MOVCW which you will discuss later). The MOVE instruction does not affect the source operand at all, but it does affect the flags in the processor's condition code register. It always clears the Overflow and Carry Flags to zero. It sets the Negative Flag to "1" if the result is negative, otherwise it sets the Zero Flag to "1" if the result is zero, plus it clears the flag to zero. The Standard Flags is unaffected. You may also like to note that the sign of the data moved is word size, because of this it will not affect the two most significant bytes in either source or destination. Other more

permissible are Byte and Long Word. Permissible Address Modes are for:

MOVE SOURCE destination

Reg	yes	yes
Reg+	yes	no
Reg#	yes	yes
Reg#+	yes	yes
Label	yes	yes
Label+	yes	yes
Offset	yes	yes
Offset+	yes	yes
Offset#	yes	yes
Offset#+	yes	yes
Immediate	yes	yes

"Byte" is not allowed.

ADD, like MOVE has two operands, source and destination. This instruction is ADD. Thought of as "sum source to destination" — that is, add in binary format the source to the destination and place the result in the destination. In this example the source operand is set to word 0000 and the destination bytes of the registers D0 and D1 are used. Similar to the MOVE instruction described above, the Source Operand is read only, and thus does not change. The Destination will contain the result of its previous contents, and the contents of the Source Operand, unchanged. To give you those of you out there who have programmed the BBC and are familiar with the ADD (Add With Carry) instruction, may be interested the Carry Flag is not added into the result when using the ADD instructions. Thus the Carry Flag does not affect the result placed in the destination operand, after the ADD has been done the Condition Code Registers flags are set as follows, depending on the results:

FLAG SET CLEARED

- N** Negative If zero or positive
- Z** Zero If not zero.
- V** Overflow If no溢出 occurred.
- C** Carry Generated If Answer can be represented in Destination.
- S** Copies the C Flag.

Now using the ADD instruction one of the operands MCW1 uses a data register as one of the operands. Plus anything it is the Destination Operand, then any Effective Address mode is permissible (see Source Comment including any data register). If you don't use a data register as a Destination Operand, you MUST therefore use a Data Register as

the Source Operand. If this is the case, then only the following Effective Address Modes are available for the Data-Register Operand:

— Modes Allowed when the Destination Operand isn't a Data Register:

Reg	yes
Reg+	yes
Reg#	yes
Reg#+	yes
Label	yes
Offset	yes
Offset+	yes
Offset#	yes
Offset#+	yes
Absolute	yes

The Second MOVE is the same as the first MOVE except the Data Register D4 and D5 are used.

The Subtraction instruction takes the source from the Destination Operand, placing the result in the Destination. Like the ADD instruction it is carried out in binary arithmetic. The instruction has identical restrictions to the ADD instruction, excepting the necessity to use a Data Register as one of its operands. Flags affect and are affected in an identical manner to the ADD instruction. In this example D0 is subtracted from D4. The result is placed in D4.

MUL is the 000000 instruction that represents the instruction to do a signed multiply of the Source Operand and a Data Register, which must be used as the Destination Operand. All Unsigned Address modes (Reg and Reg+) are allowed for the Source Operand. The instruction takes both operands as one signed 32-bit result which is placed in the Destination Operand. In the example above the D0 register is multiplied with the D2 register. The result is placed in D4. No flags affect the operation of this instruction. But all the flags in the Condition Code Register (except the X Flag) are effected by the result. The flags are affected in the following manner:

- FLAG**
- N** Set if the result is negative, cleared if the result is zero or greater than it is cleared.
- Z** Set if the result is zero, if not zero then it is cleared.
- V** Always cleared to zero.
- C** Always cleared to zero.

I have included a JMP instruction at the end of the program to skip the descriptive comments. Further into memory, it is set so that it would try to execute un-

ited instructions, but the memory contains that it acts as a "hazard exit", not allowing processing to fall through. The JMP instruction directs the processing from a position indicated by its operand, i.e. it jumps the processing to a new location. The assembler will substitute the value of a label as an instruction's operand. A label is given a value by typing the label's name in the label field. In this example of JMP we have a label "Finish" as the operand. The JMP instruction requires an address to jump for its operand. Immediately before the instruction, in the label field, "Finish" has been typed. This substitutes Finish's value according to its location. Anywhere "Finish" is used in the source program the assembler will substitute the value it has been allocated. The assembler will therefore generate the address of the JMP instruction as the label's value. When the instruction is executed it will jump back to the start of the JMP instruction and then execute the JMP again — creating an endless loop. If you run this program yourself find that the only way to reclaim the machine is either to press the reset switch or reboot the power. The JMP instruction is not affected, and has no effect, on the Condition Code Flags. Generally a preferable method of exiting a program is to use an RTN, RET or SEP instruction to return you to the calling program. We shall be looking at these in future articles.

RECAP

We have briefly looked at PD Directives as part of the memory map. We saw that 8888 instructions are formed from a Mnemonic, data size operator and the relevant addressing segments of the instruction sequence itself. That Segments could be up to two in number and that they are termed the Source and Destination. Following this was pointed out that there were restrictions on permissible addressing modes for operands and that the restriction was word-dependent on the particular instruction. The format of an assembly language source file was discussed and finally a small example was explained. Continuing the series we will look at address modes in part two.

16K Standard Colour Computer 2
Tandy's 80 Colour Computer Are Better Than Ever! We improved our most popular family of computers with a compact white case, low-profile, electric typewriter-quality keyboard and prices that are less than last year's models!

Ideal For Entertainment, Household and Educational Uses. Tandy attach the Colour Computer to any TV - then Program Patrol will let you build structures in outer space, race a race, play baseball - and lots more. But playing games is only the beginning. You can set up a budget or monitor your investments. Your kids can learn math or typing, enjoy literary classics or make glorious computer "paintings".

What Is Learn To Program? Our entertaining instruction manuals will have you writing programs with full-colour displays and sound in no time. Colour BASIC's simple commands let you quickly produce drawings, diagrams and charts. Choose from eight brilliant colours, create musical tones, solve problems, analyse data and much more. Then save your work on tape with an optional cassette recorder.

Buyout Basely. Add a pair of joysticks, a printer, and a monitor for telephone communications. Upgrade with more memory and up to three disk drives, too.

16K Standard Colour Computer 2. The Standard Colour BASIC language includes date and string handling, dimensioned arrays, math functions and 9-digit numeric accuracy. Includes entertaining 200+ page beginner's manual. 26-3038 £169.95 Save £60.90 (2119.95)

16K Standard Colour Computer 3. All the features of Standard BASIC plus enhanced programming capability to create, high-resolution colour graphics using single-line text commands. Includes total extensions on Standard and Extended BASIC. 26-3037 £169.95 Save £60.90 (2119.95)

Colour Computer Joystick. 26-3039 Pair £9.95

Colour Computer Upgrade Kits. 26-2038 £5.95

Extended BASIC Upgrade. 26-3018 £79.95

Extended BASIC Upgrade. 26-3019 £99.95

Slow, Slow, Quick, Quick,

TERRY WATTS, star K-TEL programmer, admits that he's not only a veteran of the Rock and Roll generation, but an uncontrolable music enthusiast.

Terry's arrival is best equated with that of the lightning that suddenly cuts across the screen in his games, City-Attack, Bouncy, Lightyear and Encyclopedia. He has a very dancer's frame that has turned its way through many a song in his solo life as a disco teacher.

A Disco Teacher?

So how did the Suave Southpaw get programmed?

"A dead giveaway of the music enthusiasm is familiarity with gold patry. Computers seemed like a gadget per seficiency. I just had to have one. So I bought."

A few months later, Quickfire found themselves with Quinton Warrier, a 16-20 bus-driver.

CLASSICS

Terry wants to write classics — games that are totally absorbing time after time. "Some games simply pass you by," explains Terry.

"You are compelled to keep playing out of sheer frustration, but you don't actually like them." Terry has written two very sophisticated games for K-Tel, (Aggression and City Attack), which certainly prove his point. "We asked him for the recipe."

"I don't start by trying to think up original ideas. I play for hours, searching for a 'hook'. A movement, perhaps, only lasting a few seconds — but one that you want to keep doing again and again. That's my trigger to a train of thought ... and I'm off!"

Mistakes can also be a source of inspiration. Should you get shot whilst playing City Attack, observe the flickering tongues of flame that

You don't have to be 13 years old with zits to be a whizz-kid. **TERRY WATTS**, K-TEL'S ace code-godader, is a withered 42, for example. AND a former Ballroom Dance champion. How unlikely a combination is that? **NICKY XIKLUNA** investigates . . .

engulf your game craft. Realistic, huh? Terry stumbled across this effect when he forgot to terminate a lightning that, it combined with another character, and the resulting sprite exploded ala-bang! "BAM!" cried Terry, for he had discovered fire.

Being a little older than the common garden variety has its problems. Running a home studio and a young family take up a lot of time. Terry's favorite programming hours are midnight to 8am. (Watching musical shows — Ed.) His young son persuaded him to become interested in order to avoid distractions. Whilst fending a complex game, Terry was distracted by the boy. "Look, Daddy!" said民主, investigating an electrical plug and leavening with pride. The whole program vanished down the tube. Terrified, I asked Terry what he did about it.

"Patted him on the head," said Terry. "Huh."

But Terry also indulges: tape in excess years. "I'm not as easily satisfied as a 13-year-old. The young haven't started disappointment, and don't realize just how hard it is to succeed. You've got to be completely set on what you're doing. The most important thing is never to give up." No doubt mania on this topic helps.

ENGINEER

Terry had no formal education. He informed his career advisor that he was going to be a television engineer. He was offered a choice of three road sweepers or park attendants.

Our hero nevertheless managed to become a television engineer, but failed to find the glamour life held forever. It was then he began to mull over the idea of radio-station.

Unfortunately his hand consisted of fifteen guitars, so he preferred to fantasize about their impressive shadow than pursue their instruments.

All except Terry. (But then he had that cool M.R.)

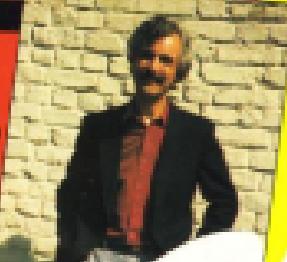

"The only way we could get through a number was to split the load into sections so that we could take turns in each stage a little bit." Meanwhile, the guy who was supposed to be playing lead, missed.

This glorious group finally found themselves a drummer. It was then that it dawned on them that none of them could keep time. They promptly used vinyl LPs instead.

Terry grew patient. "There are parallels between what was happening there, and where we are now in computing. For a while it seemed that the world of music could be anyone's oyster. Then the industry became increasingly professional. In computing the importance of the programmer is declining as P.C., advertising, distribution, etc. become equalized. The competition and the standards are getting up of the time. Professionalism has become the most important thing in writing today."

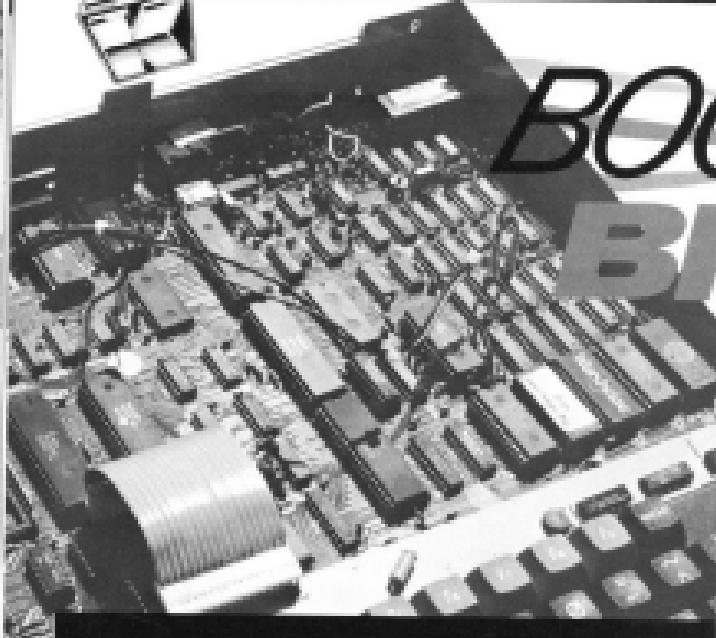

So what's Terry up to Professional? "Oh, it's a completely new concept in gameplay." Well? "All I can say is that it uses lots of machine code, and it's half way through it." This presumably brilliant design had suddenly gone quiet. Could this perhaps be Terry's adventure disease? Could it be K-Tel's newly announced blockbuster?

At this point he looked at me seriously, and placed a hand over my mike. I can say no more . . .

BOOST BRA

Excellent machine though it is in every way, the Acorn BBC Model 'B' is hampered by lack of on-board RAM memory (as anyone running the BBC DOS would agree). There are times when every byte can be vital. In this article, ROM ALDUS explains how to add another 2K in the form of a 'RAM chip' — to fit in those handy Sideways SMD sockets.

SO YOU'VE built your Big K EEPROM Programmer and probably tried it out. If your first experiences of EEPROM cloning was anything like mine you probably had to reset the chip after the software, reboots the chip, try the boot and start all over again when the chip still refused to work. After about a week all I had to show was no cat and a worn out EEPROM.

Before you think I'm being out of the picture, there is an alternative. 2K RAM chips have pinouts very similar to EEPROMs so they can be adapted to fit a sideways EEPROM socket, and they cost about a fiver.

2K doesn't sound very much but 2K means 2 pages of memory. That's plenty enough to develop utilities and service sized routines off and an advantage of around thirty pounds over an

8K chip certainly makes it appealing.

First of all the ingredients. You will need one 2K pin DIL socket and a Hitachi H116 LP 2K static RAM chip. These are available from Technomation or Warford Electronics and should cost about a fiver all in.

A word of warning about the chip. This is what's known as a CMOS device which means it's very prone to static electricity. Your body is capable of storing static electricity in enough quantity to destroy the chip. So always discharge yourself before you do, earth yourself by touching a metal bar or coldwater pipe.

While on the subject of warnings, the operations described here must guarantee the computer. Some parts (notably the RAM) can be damaged by rough treatment and some parts are more than capable of damaging you if

the machine is still on. So be CAREFUL! Turn off and unplug the computer before you open it up and treat it with respect. Neither the author nor Big K can accept any responsibility for damage done to either you or your computer by hapless and missing around.

The slight problem is that there are four more pins on the EEPROM than on the 2K chip so you need a way of getting the right pins in the right holes. Jumping up and down on it doesn't seem reliable so we'll cut down the DIL socket and use that as an adapter.

Take a look at diagram 11 and you can see how the adapter is made. A minor amount of soldering is required but this should cause no great problems as long as you DON'T disconnect the computer. Hot solder hurts circuit boards.

First of all use a small pair

DIL Socket (top view)

of side cutters to cut pins 26 and 28 from the DIL socket. Turn the socket over and insert the chip into the socket as shown. Make sure that the notch is at the top and that the four top holes of the socket are also at the top.

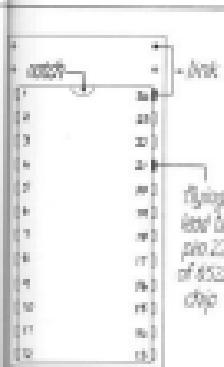

Insulated

Now comes the soldering. The first is a link from the top right hand pin of the chip to the top right pin of the socket. Use next or 0.1" tubing, load about 20% of the wire and don't be afraid to melt along. Both these leads should be insulated single core which you should be able to get from the same place as the wire.

Now we can insert the chip which means connecting the computer. First of all TURN IT OFF UNPLUGGED!

Look at the back and the underside of the computer. You should see four screws

YOUR BEEB'S INPOWER!

the rightmost socket and should stay there. To get the RAM chip out gently pull the blade of a screwdriver under the top end and prise it loose, then do the same at the other end, being careful not to bend any pins. The chip should have been loose enough to ease out by hand. Now replace it in the rightmost socket [18] by putting one end in first then gently easing down the other end. A little push just pushing up and down on it should see it in place.

You can now insert the RAM chip, slightly in its socket, into socket 12. This should go in the same way as the basic chip, with the notch at the top.

The flying lead which you

soldered to pin 21 has to be soldered onto the 6522 VIA chip. That's IC608 as shown in the diagram and is soldered onto pin 22 as shown. This has to be done over the main circuit board so the CAPTURE!

Now you should be all set up and ready to go. Reassemble in the exact reverse of disassembly but remember, replace the cover before you switch on. If everything is OK, the computer should function as normal and it'll be ready for the software. This is basically a protection mechanism for memory to put into the RAM chip so you know that it's working. Andy Green's article in the May issue of *BBC Micro* gives a pretty good idea of how the

ROM works so I won't go into much detail. The basic action involves two routines, PROCreate and PROWrite which you can use to read and write to the chip. To read from the chip at location "address" use PROReadAddress [and use PROReadData [address]] to put the number "data" into location "address". Simple isn't it? Alternatively if you want to dump a whole section of memory out to RAM use PRODump. This routine takes the 2K buffer at \$3000 to \$B000 into page 1 RAM but don't forget that the chip must have a higher value at the start. If you want a different size to the one I've given then that's an Andy's feature as well.

marked TUR, two on the back and two on the bottom. Remove these and tag of the computer will lift off. Remove the ribbon connector from the keyboard circuit board by carefully prising it with a small screwdriver and then undo the retaining nuts on either side of the keyboard. Remove the two backplane links from the main circuit board, noting which. Any sound damage and you'll get the phone bill to the police.

Take a look at chassis part 12. The ROM sockets are the four in the bottom right, numbered 12 to 15. You have to remove ROMs three, four and six in socket 12. When the BBC powers up it goes directly to the first chip it reaches, reading from the ROMs. It would carry like it is day that way so, as we shall have to shift the ROMs around, we need to position the ROMs in parallel. If the ROM then this chip will be in

OF HIGH JINKS AND ANTICS...

In the third part of this award-winning, epoch-making and groundbreaking series on ATARI GRAPHICS, NEIL FARRER explains how, by some diabolical fiddling with the display list, all sorts of bizarre and jewel-like effects become possible. Like multi-coloured character sets, for example...

MANY OF the colourful games that are available today on Atari do not actually use any high resolution graphics mode. They simply use a GRAPHICS 0 screen and colour. According to the Atari reference manual you can only have one colour with these limitations. However, there is an extremely simple way of obtaining four colours in a GRAPHICS 0 screen and also have a high resolution definition.

The Antic chip

The answer lies with the ANTIC chip. Although you only have twelve possible GRAPHICS commands, there are a possible sixteen variations of ANTIC commands, measuring six integers and three programmes. For those of you with one of the many 16K computers life is made much simpler as they have been built into the GRAPHICS statement.

One of the major functions of the Antic chip is to control what appears on your television screen. To do this it needs several pieces of information. Firstly it requires a set of instructions that tell it what mode it is in and secondly it needs to know where to find the screen data. The set of instructions for Antic is known as a display list and the address of the display list is located between \$60 and \$61.

When you are in a GRAPHICS mode 0 screen, Antic is actually in mode 21 (normal). Things are never as straightforward as

they should be. Our resolution-limited GRAPHICS mode 0 is in ANTIC mode 4. Therefore all we have to do is to slightly alter the figures in the display list into fooling Antic that it is in mode 4.

The Display List

Finally let us look at the ordinary display list. As I have already stated, its location is held in \$60 and \$61 and can be found by the following simple piece of arithmetic:

$$DL = PEEK(560) + PEEK(561) * 256$$

Location \$61 holds the 'high byte' of the address and \$60 the 'low byte'. We therefore have to multiply the high byte by 256 (remember that one byte and screen being 256 bytes long!) and add in the low byte. The variable DL now contains the starting address of the display list. In order to see what the display list contains type in the above and follow it with:

$$PDR X = DL TO DL + 3n$$

PRINT PEEK(DL) NEXT X

If you have typed it correctly you will get a stream of numbers appearing on the screen.

The first three numbers should be 112 which tell Antic to put a few blank lines at the top of the screen. You should then have the number 66 followed by two other numbers depending upon how much memory you have got. Following this will be twenty three 2's. Finally another three numbers depending upon the state of your memory.

GRAPHICS mode 0 is ANTIC mode 2, remember. Right is the mode of instruction we have a mass of 2's using the Antic chip; what mode is it in for that display line? We therefore have to change all the 2's into 4's.

If you look at the list of numbers again you will see that the fourth number is 64. This is actually made up of 64+2. This

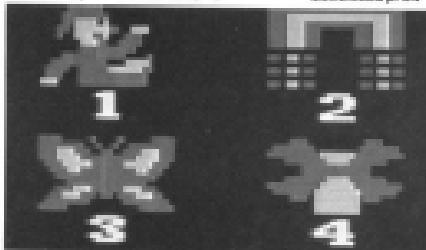

therefore has to be changed to 64+4, i.e., 68. If you now type in the following program it will convert the whole screen in Antic mode 4 and put something on the screen so that you can see the effect.

```
10 GRAPHICS 0: LIST
20 LIST
30 D = PEEK(560) + 256*PEEK(561)
40 POKC DL+3,68
41 FOR X=8 TO 29
42 POKC DL+X,4
43 NEXT X
```

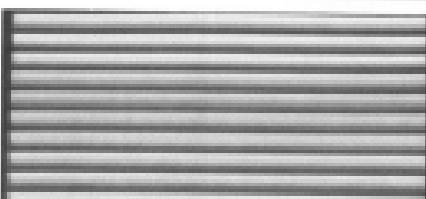

What appears on the screen is virtually illegible. You have got multi-coloured characters, just to prove that it really is there after line 4 to read:

```
44 PDR X=6 TO 28 STEP 2
and then RUN the program again. Now only every other line is in ANTIC mode 4 and the others are normal mode 2 lines.
```

Continued p. 94

Meet Slurpy

Slurpy has the biggest appetite in the world. He spends his day slurping tasty treats such as donuts and McDonald's french fries. Slurpy Slurpy may even slurp poisonous creatures which he must immediately spit out again.

To his enemies, Slurpy's plump little body is a delicious morsel. He must constantly be on the look out as he slurps from cave to cave where he encounters earthquakes, volcanoes and phantoms. Help Slurpy eat his fill before something eats him!

Slurpy is an amazing fun game. Superb graphics, colour and sound really bring Slurpy to life. The game comes with an eight page manual and a free poster offer. You can find Slurpy in all major software retailers.

COMPETITION • COMPETITION • COMPETITION

WIN

in our super

This month BIG K, in conjunction with K-Tel, is proud to present one of the most exciting competitions ever run by a computer magazine.

The lucky winner will receive (A) a week for two people in Florida, USA; (B) all expenses including flights, hotel, car hire and \$5000 SPENDING MONEY; and (C) a trip to the Kennedy Space Center. Win the trip of a lifetime and WIN ONLY IN BIG K.

Runners-up will receive prizes of K-Tel software on either cassette or floppy-disc.

**None of whom MUST be
over 18 years with a driving
license**

ABOVE: THE SHUTTLE boards into orbit from Cape Kennedy, Florida.
RIGHT: Inside the big bird. The winner won't get this far, but you're in first!

COMPETITION • COMPETITION • COMPETITION • COMPETIT

A WEEK IN FLORIDA!

Big K-Tel COMPETITION

RULES

There is no entry fee but all entries must be on a pre-printed coupon from BIG K and must bear the entrant's name, age and address.

Entries accepted early will be excluded and this Big K Competition will be excluded if, in the opinion of the judges, has shown the most skill and judgement in assessing the merits of the alternative factors for each of the nine pairs. Participating prizes will be awarded for the most highly ranked in order of merit. No entrant may win more than one award.

In the event of a tie for first or any other prize, a further test of skill will be conducted by post between tying contestants to determine the eventual winner(s) or winning entrants.

All prizes must be accepted as offered. There can be no alternative prize, cash or otherwise. No cash prizes will be given to anyone under 18. Unsent parental consent must be produced before the prize can be awarded. The winner need not be accompanied by a responsible adult on the holiday which can be taken at any time during the competition period subject to availability of bookings.

Any entry received after the closing date will be disqualified as will any received late, illegible, incomplete or not complying with the rules and instructions clearly. No responsibility can be accepted for entries lost or delayed in the post or elsewhere. Proof of posting will not be accepted as proof of receipt.

The judges' decisions and that of the editor in all other matters affecting the competition will be final and legally binding. No correspondence can be entered into.

The competition is open to all residents in Great Britain, Northern Ireland, Isle of Man, the Channel Islands and Isle of Man racing employees, and their families, of BIG K, the principals of BIG K and their publishing agents.

All winners will be notified and the result published later in 1984.

COMPARE THESE FACTORS

1	A. Loading title page	B. Attractive packaging
2	A. Good graphics	B. Related package
3	A. Multifunctional option	B. Choice of strategy/ adventure
4	A. Increasing difficulty screen	B. Random feature avoiding instant game end play
5	A. High score table	B. Step action option
6	A. Smooth scrolling	B. Continuous sound effects
7	A. Picture level	B. On-screen subroutines
8	A. Machine-code compatible basic	B. Available for various machines
9	A. Clear documentation	B. On-screen scoring

HOW TO ENTER

There are nine pairs of factors which are to be considered when selecting an arcade game suitable for home computers. Of course, a commercial success is the main aim and so all the factors are desirable. However, for the purposes of this competition what we want you to do is decide which of the two possibilities in each pair is more important when trying to design an appealing home computer arcade game — is it A or B as far as EQUALY important?

Write the key letter (A or B) of each chosen answer in the appropriate space on the entry coupon but if you consider them both to be of equal merit mark a cross (X). For example, if you think that "loading title page" is more important for the first pair put A under 1 on the coupon. If you think "attractive packaging" is of greatest importance put B for 9. If you think they are of EQUAL, reveal put X.

When you have completed all nine pairs in this way, complete this coupon — in full as required — with your full name, age and address and then post your entry in a sealed envelope to: BIG K-Tel COMPETITION, 10 FAKER STREET, LONDON EC1M 4BT to arrive no later than Friday, August 31, 1984, the closing date.

IMPORTANT! Before sealing, copy out on the outside back of the envelope the nine key letters in EXACTLY the same order as they appear on your completed coupon. Do not enclose any other correspondence. FAILURE TO COMPLY MAY RESULT IN YOUR ENTRY NOT BEING CONSIDERED.

WONDER

ENTER THE FUN GLOVE

Scrubby the all-time prize for Agent Double Cross over must be given — no contestors — to Coleco, whose Super Action Hand Controllers are easily the most bizarrely weird game pad.

They resemble the looking-glasses of a labo: grey metal and plastic game bats that almost endow you life. On top: a hand for Coleco games.

selection combinations, full-handed stick with shield arm, and basically sixteen action buttons on the Coleco game system. There's also a hypothesized while button plus a button that halves a cursor in certain Coleco games.

Underneath the fingers, four receptors for thumbsticks, one for each digit. Again, these have special implications.

Though hand and gauntlet to the point of insanity to look at, these things — like the much Money-Mouse American implementation — actually work very well. The full stick is positive and naturally, almost micro-thresholded.

WICO, YOUCO, THEY ALL GO

You've been able to get the Wico range of joysticks in this country for some time now, though not "officially". These folks have had no experience with these American controllers known to be without equal for flexibility and neatness of action. Now they've found a home in the UK in a company back East, who already distribute the Coleco Macrocoder plus the importation of Amicocones in the US. They now distribute the Wico range through Carlton Electronics.

Like all US companies, Wico targets Atari, Apple and Commodore in mind solely (though with the various Joysticks) — come up with a computer with Spectrum power, doesn't consider them still take power to you with the Macrocoder £12.99 — the option of both a quality-wire with the Pro-Schock or Spectracolor £1. Mico or up to the Macrocoder for shape, action, weight and sensitivity — many dimensions are plus to £14.99. These micro-sized joysticks are precision instruments, like hammers, will approve of the price representation to the £1.99 standard model. Three stampede handles are supplied — a micro-handled flat and three contoured shapes.

In the US, Wico's price is much a manufacturer's mark. Note that their prices are significantly lower than when they first arrived, often far expensive there too.

Upcoming BIG Controller Review

ELECTRON DIGITAL

Although users didn't know their while they Atari a good BBC in its racing days, they also have a machine frustratingly difficult to expand. Atari programmable included all along that parameter relating to expand would naturally go for big shot, but that's not the way people think.

That aside, computers controlling — if need be used, Action! have been actively working on the not inconsiderable task of making the Electron even slightly expandable. Per-

haps onto the point of a decent payload.

Digital sticks can not yet be the Electron. It's either Analogue or the keyboard. The range of Action-compatible sticks is, like the best and the most, and as never been unavailable. Until — you guess it — now.

FBC Systems of Daventry you know them as First Electronics have produced a little inexpensive bit of hardware that lets anyone Pro-Schock, Spectra II, etc., all tell the Electron. We guess it goes into the

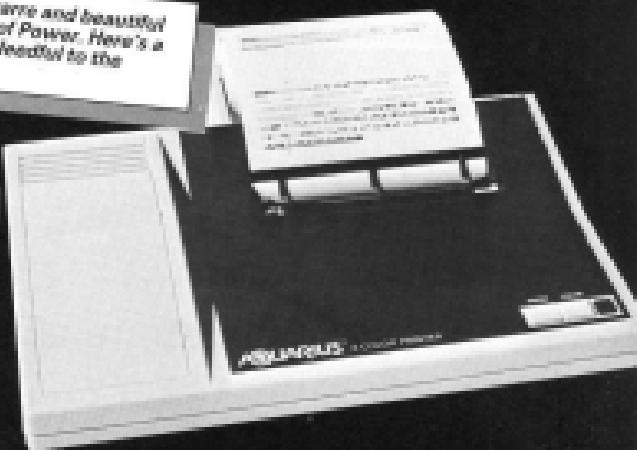

Each month a new slew of bizarre and beautiful software arrives at the Tower of Power. Here's a selection — from the Next 'n' Headful to the Humbuggy Nut.

AQUARIUS SWIM IN SPECTRUM WATERS WITH NEW PLOTTER

When Marconi's electronics division nosedived into the fertilizer last Christmas many folks assumed that was the end of both the intelligent games system and the budget Aquarius computer.

But Aquarius' latest 168 ROM expansions and more software (including "small business" packages as well as the LOGO language) have jerked it back even at the end of the year spectrum, today, it doesn't exactly sell in boats, and probably never will, but the machine has now generated a series of really peripherals, all of which are Spectrum-compatible. The first of these to be revealed is the Aquarius 4-colour plotter.

It's a soft-and-dark-blue pinstripe package about the size of a book of 50 pages. It takes the usual 40-column roll of paper (any paper, 200 columns), prints text and偶像 graphics in two passes at four colours, and possesses its own remarkably comprehensive character set. All of

this can be generated by either an Aquarius computer or — and this is much more of a prospect — Sinclair Spectrum using interface.

Connects with the host Aquarius via a miniature jack serial cable. On receiving (which must be done before switching on the computer), the printer gears up with a whinge or two, then spits out four filled circles, each in a different colour. The pens, by the way, are insulated and removed with tamatic ease, and are about the size of 20 tablets. By holding down the PAPER feed button while switching on the Aquarius can be made to generate its complete character set in either 40-or 80-column measures. The aqua-quality of the latter, highly-mineralized print is breathtaking for a machine of this price.

It operates in three modes: text

only, mixed text and graphics (with alternate character sets), and graphics alone. And it can function in the normal way (titled instead) as a simple program (either the LLST command, text reproduction (via LPRINT), or you can invoke a couple of protocols and convert it to a plotter.

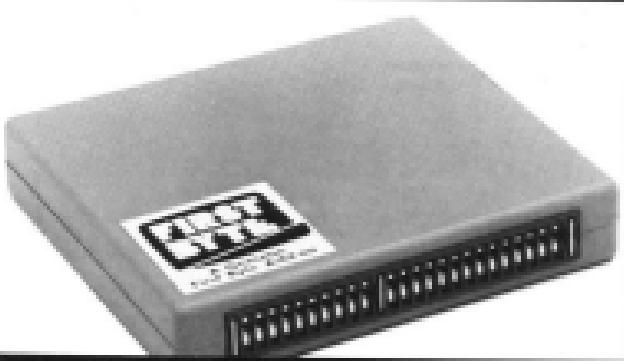

A printer — possibly after a disc drive — is most people's choice of peripheral. Four-colour printer technology is now, in its water reaches, a fine and expensive art. It was inevitable that before long someone would produce an example of the same technology to suit the "budget" end of the market. In the UK, this means Spectrum, and the fact that the Aquarius Plotter/Hyper runs on Spectrum (via an RS232C feed) must make it a sensible choice.

DONGLE

User Price, as it were, the price is £24.95.

Unhappily Acorn have also chosen this moment to unveil a range of Electron add-ons, for £28.00 and lucky Electron people can get themselves hooked up with Plus 1, an all-purpose expansion box.

All together in the unit are a semi-thin printer port, two ROM slots, and a single cartridge joystick port. So you still have to use the First Byte converter if you want to use Electron disks.

WAREWARE CORNER

We had to get this one in. I've had an award for the longest badge of the month for three months now. Should I this month? I guess you would barely go to extremes at the great Z81 and ZX80 Shows in Rubber Keyboard.

Astrally, it records. The memory buffer board of the ZX80 (not a separate machine yet) is in fact pretty sensitive and the rubber keyboard when stuck in place actually softens the contacts in place, although you can't really hear them. And yes, after 400 presents, nearly half go for it in large amounts, presumably because in Rubber's dreams in their desire to get implemented up.

What makes us want, though, these big R's, is the sort of influence mass of the thing. Rubber (Steve,

now 18, Stockport, UK) has the ZX81 4000! (Observe that most machines 1,000, and some of those digits would simply not fit within this device for the purposes intended.)

It is claimed (I am reported) as an AMT project that this splendid piece of microprocessor space has its own. To add Power Please to your system, there's a socket like a BBC B Amiga here. Based round it a home affair to the original state of his C64-like system. It seems to be a dual function keyboard, four keys, rollers and scroll bars and other recognosities, promising it to be like ultimate top computer, plus lots with questions. He's developing quite a good line of power on the subject.

Can we all have one, please?

Spectrum owners never tire of bashing about their keyboards and who's to blame them? For this reason there has always been a substantial amount of interest in conversions (keyboards, of course).

Newest to emerge in this field are Advanced Memory Systems, who offer a low-profile full-size conversion kit for £19.95. Amongst thoughtful options are the Standard Layout and the provision of a proper space bar and a dedicated function keyset. About processing is a number of integrated packages for Spectrum users which have a real possibility — which naturally enhances the usefulness of other Spectrum peripherals, membrane drives and even microdrives.

Advanced Memory seem to have a knack of targeting certain small but interesting areas of the market — you may remember them for a recent 3" Hitachi microfloppy drive they provided to 8-bit Acorn's BBC-DOS.

SOFTWARE

Bob Hamilton's best selling Spectrum game has been beautifully converted for the Commodore 64 by John White with many additional features fully utilising the extra capabilities of this machine. The Pyramid contains 120 chambers on 5 levels. In order to get from one chamber to another you must fight off the indigenous aliens to collect an energized crystal which will neutralize the force field guarding the two exits. The Pyramid is defended by a total of 120 different beautifully animated aliens (more than any other video game in history!), one for every chamber and each with a unique attack pattern. They manifest themselves in the most amazingly diverse and peculiar forms from the squinting solar siphons to the extra-terrestrial tweezers and a whole host of entities defying rational description. You will have great fun inventing your own nicknames.

You proceed to explore the Pyramid from top to bottom with the difficulty increasing with the depth of level as the attack patterns get more complex and the aliens become intelligent.

Depending on the choice of exit from each chamber you are likely to have a different game every time you play.

Apart from the challenge of trying to achieve the highest score possible the Pyramid contains a number puzzle to solve. The more chambers you successfully visit the more information is gathered to enable you to unravel the secret numbers of the Pyramid.

This is "DUGGY", he is shown above in his exploratory capsule and is a true representation of the on screen graphics. You have total control over his movements as you explore the many chambers of "THE PYRAMID".

Annotations based on the previous work of the authors focused on four categories: writing, reading, listening, and speaking, and they apply mainly to the first three. However, the focus of this study is on listening comprehension, which is a key skill and plays an important role in many language learning processes, such as reading, writing, and speaking. Therefore, it was decided to focus on listening comprehension. This study makes a contribution of different researches, not yet published, and finds three common language learning approaches for every language teacher, which can be used in teaching English as a foreign language. The first approach is "the teacher's role is to teach students how to learn English," the second approach is "the teacher's role is to help students learn English by themselves," and the third approach is "the teacher's role is to help students learn English by themselves." These three approaches are based on the results of the study.

Don't Just Sit There Moved

SINCLAIR'S ADVERTISING BUREAU proudly proclaims the Spectrum as a big 16K resolution Micro offering a definition of 256 x 192. Even the small print doesn't tell you that you can only PRINT a slightly defined grid of 32 x 22 character squares.

Okay, so you can use short to produce static pictures with the full resolution—but that's what they are, STATIC and uninteresting, at least from a gamma viewpoint. As for the alternatives... Well, what alternatives? You could conceivably construct the characters by shifting certain adjacent pixels on the screen but that is exceedingly slow. You could of course forget that you've got a high resolution machine altogether and opt for low-resolution character movement in any game you like and with characters as large as enormous great leaves as they are transported around the screen. A lot of very good, recently BASIC games have been written in this way. Mind you, if you forget about the high-res you might as well forget all about colour sound and all the rest of the associated paraphernalia and replace your Spectrum with a slightly less-graphical (but a lot faster) computer—perhaps a Z80 with a few screens too!

Porting away the problem is not insurmountable and can be solved with a short program although a longer routine is desirable. In this shortest form, machine code. A short machine code programme to perform such a task is shown in Listing 1. The machine code is tucked away above RAMTOP well away from the

danger of overwriting by BASIC. Since the address of RAMTOP differs from the 48K to 16K machines the 48K, it is necessary to have two versions of the program: one for each memory size. If you have a 16K computer then type in listing 2 rather than the first listing. All the program does is to poke the machine code into memory. When you've finished keyboard bashing you're ready to RUN it. The program incorporates a checksum to verify the accuracy of the data, so if you've made a mistake it will tell you so and give you an idea of where to look for it. Once the program has successfully RUN you can save your machine code on tape using the commands below:

For 48K owners — SAVF "Hires Print" CODE 85118,252
For 16K owners — SAVF "Hires Print" CODE 85248,252

You can reload the program at any time by doing:
For 48K owners — CLEMM 65118; LOAD "CODE 85118"
For 16K owners — CLEMM 65248; LOAD "CODE 85248"

It's a good idea to save and write it a couple of times in case any devastating calamity should befall your first recording. All that the machine code does is the equivalent of poking a character onto the screen but at a much more respectable rate than BASIC can ever hope to do. The machine code also has to do a bit of fiddling about with binary numbers when a graphic address has two or more character squares.

To print a character using this routine requires 3 pixels followed by a machine code USA call,

not surprisingly. The locations which are poked differ between the two versions of the program so remember to type in the right ones or you could find yourself crashing on you. The first location always defines the x coordinate of the position where you want the character you wish to print. To save any hassle with padding and USA statements it is a good idea to have a small general purpose sub routine in which you can tell where you want to print a HI-Res character. Such a subroutine is listed below:

For 16K Machines:

```
8500 POKC 85248,CODE
@ 8510 POKC 85248,X:
POKC 85248,Y
8520 RANDOMIZE USA
8530 RETURN
```

For 48K Machines:

```
8500 POKC 85118,CODE
@ 8510 POKC 85118,X:
POKC 85118,Y
8520 RANDOMIZE USA
8530 RETURN
```

When the subroutine is called, using "GO SUB 8500", the variables @, X and Y must hold certain parameters. @5 holds the character that is to be printed. The programme then tries to print any of the basic characters set held codes 88-107; press definite characters held codes 144-163 but you're not allowed to print taken on the graphics characters available on the top row of the keyboard when in graphics mode.

X holds the x co-ordin-

ate (0-255) position of the top left hand corner of the character to be printed while Y, again predictably, holds the y co-ordinate (0-192) of that point. Note that unlike PLOT and OFF-CLE etc, the y coordinate is measured from the top rather than from the bottom of the screen as that 192 is at the top left rather than at the bottom left hand corner of the screen.

So, for instance, USA @5-A, LEFT @-128, LEFT Y=88; GO SUB 8500 prints the letter A staying in the middle of the screen. Try it and see. The below listing:

```
10 LET y=88
20 FOR x=1 TO 256
30 LET z=x-1; LET u$=" "
40 POKC y,x,u$
50 LET z=z+1; LET u$="D"
60 GO SUB 8500
70 NEXT z
80 STOP
950 (The Hi-Res Printing routine)
```

will hopefully move the letter D across the screen from left to right. Notice that before a new 'D' can be printed the old one has to be erased by inserting it with a space. That space makes it a result of the fact that the 'D' is completely absent from the screen for a short period just after the old version has been overwritten. In a later article I will explain how to overcome this problem to a large extent. If you add STEP 2 to the end of line 20 then the movement will be much faster although not quite as accurate. You can arrange the x and y coordinates so that the movement is a little more interesting. You can use some of the computer's trig and other mathematical functions to produce

Listing 3. Illustrates another aspect of mouse control — acceleration and deceleration. You can move a dot around the screen using the cursor keys. Upon pressing key "up" the \square , initially positioned at the center of the screen, moves towards the top; as the velocity is not constant, the dot reaches the top speed gradually increases. The hard work in the program is done by the subroutines 1000 and 1010 which gradually work out what the limits of the distance between the dot and the top and move the \square that distance towards the dot. As the \square nears the dot the jumps gradually get smaller so that the \square moves there slowly.

"When you've seen all
your favourite
videos, beaten space
invaders and want
more than computer
logic..."

The Yamaha PS-55

The PS55 enables you to make your own music right from the start.

At the touch of a button, you can recreate the fantastic sounds of Disco, Rock, Jazz and Classical music.

And you have the freedom to play it your way—because never before has there been so much music in a portable electronic keyboard.

The PS55 has a Solo Section, an Orchestral

Section, Drum Rhythms, plus hand-claps and a drum fill-in.

More than 40 sensational musical effects—ranging from Symphonic to Cosmic.

There's a built-in 3-track recording unit for independent recording from each Section.

And for a completely integrated home entertainment system you can easily connect-up and playback through your stereo hi-fi cassette deck and speakers.

The PS55 has practically limitless creative potential, and promises a lot more than computer logic.

Available at your selected Yamaha Mainline Dealer. For complete details—simply return the coupon...

THE IMAGE

TV Effects machines such as Quantel's Paintbox and Mirage are as far above common-or-garden home micros as a Lamborghini is to a ducart. It seems there is literally nothing these devices can't achieve by way of graphics and image manipulation. They are truly the State of the Art. But which art? KIM ALDRIS reports.

THURSDAY 12 NOVEMBER: In the morning and the phone was ringing. I reached out of bed and took over the call. What had better be good. It was Big K. They wanted entertainment — fast. Subject — computerized special effects in film and video. I poured myself a coffee and thought quickly. This was going to be a tough one. Reaching for a chisel I grabbed my book of parameters and came up with two names. The Moving Picture Company, one of London's biggest video postproduction units who had a large film special effects unit; and The Digital Effects Company who specialized in video computer graphics. Sure of one and start that it was going to be good.

First stop was The Moving Picture Company where I met Maggi Allman, the production manager.

MOTION CONTROL

We approached a small black door at the end of a dark 10 corridor. "This is Motion Control Maggi said. We headed in and were immediately hit by something that looked like Star Wars' Death Star. Inside a massive black cube sat a large black computer system with a monitor camera on top. Within this framework is a mass of pulleys, rods and motors all dedicated to moving and focusing the camera. Magi single-handedly moves and rotates in many directions while the average person goes mad.

Basically this big is a large platform turntable with a video camera on top.

Within this framework is a

mass of pulleys, rods and motors all dedicated to moving and focusing the camera. Magi single-handedly moves and rotates in many directions while the average person goes mad.

All this is controlled by the computer. A mere 200 BBC microprocessor based machine housed through a massive tangle of wires like an orangutan in a pile of spaghetti. In fact the head, this is Peter Tynan and Maggi, that's in charge here. Maggi added. Pete for a documentation and he walked over to the control desk. Handed me across the keyboard, producing a totally incomprehensible array of

figures on the plasma display. Suddenly, with no warning the base flew along at 10000, a current on the track generating electricity. Pete pointed to a monitor screen above the control desk and we established a spaceship fly into the distance, do a gravity roll and then disappear out of the top of the screen. A quick glance down the end of the track revealed that the spaceship was in fact a model, the impression of movement being given solely by the movement of the camera on the rig.

Scratches in Motion Control? Answered Maggi "We've got it all there's a string-fighter and highlights in metal surfaces. There were all models made in Motion Control by analogy to this one, in the States. Essentially it's a robot camera which can move in many directions while the average person goes mad."

Basically this big is a large platform turntable with a video camera on top. Within this framework is a mass of pulleys, rods and motors all dedicated to moving and focusing the camera. Magi single-handedly moves and rotates in many directions while the average person goes mad.

All this is controlled by the computer. A mere 200 BBC microprocessor based machine housed through a massive tangle of wires like an orangutan in a pile of spaghetti. In fact the head, this is Peter Tynan and Maggi, that's in charge here. Maggi added. Pete for a documentation and he walked over to the control desk. Handed me across the keyboard, producing a totally incomprehensible array of

and was the title sequence for NBC's "The Hunted World". Six chess pieces into the picture one after the other and house on top of each other. Once they're all in position a globe appears and over them, the edges of the chess forming the tell-tale lines. Each piece was forced separately flying into frame, just as one might expect this computer has all sorts of tricks up its sleeve. Through moving chess moves is fairly simple until you get used to the way the string works, but hidden in the depths of this machine are all sorts of routines for different effects. For instance you can have the camera do a time exposure on each frame and at a preset request, say half-way through exposures, make the big move. The result can

be any moving object with a smooth path behind it. The length of the tail can be varied during the shot so that it's made to "catch up" with the object.

The Moving Picture Company is unique, built from scratch on the principles. As Pete put it, "We thought, what the hell, we can do it better than anyone else so we brought together and nothing happened and that's ourselves."

PAINTBOX

THE, THAT'S about most systems in that they need a trained operator to make them do more than an impressive pose of useless junk. Quantel's Paintbox, on

BENDERS

The software I used, Paint Shop, designed so that a complete technical novice can get results at first sitting.

I watched two Compass Technical Mirror mode and set down at PaintShop. A video monitor, a pen or brush and a pencil on the end of a stylus in front of me poised up the pencil and I need writing within, it's broken. A nervous technician caught me then asked, "Look at the screen, what's your next message? Was she lying or was I? I looked at the screen and there, sure enough, was a faithful reproduction of my message. I tried writing my

name, got it wrong and tried again. Then he let an expert take over. That's where Alexei Shilov, one of The Missing Pictures Company's designers, came in. I'd given her a live picture of myself to play around with on PaintShop. Something I might name no longer. I watched as she started work. Oh my god!

The whole concept of PaintShop keeps all the complex workings completely hidden from the user. He doesn't even need a keyboard. The page of icons is in fact a drawing tablet, the stylus a pen and underneath is hidden a graphics

Not just TWFX, but your actual Anarcho stuff as well. This series of CDs was shown using Quantel's Paintbox —from-the-end—user point of view, a formica tablet, a stylus and a scrawly old bit of pencil — then coloured and overlaid to form a showpiece catalogue cover (left). Total of instantly accessible shades: a mere sixteen. But shaken together as if they were paint and this number exponentially spills to a cool 20 million. Roll over Imaginal.

Access time for any one image using Paintbox is 1.5 seconds. However frames can be stored on film or videotape and then run as fast as you like.

system for shooting anything poseable with traditional colouring materials, and more, for electronics.

Using the system is simply itself. Draw with the stylus on the digitizing tablet and the result comes up on the monitor. But there's more to it than that. With the stylus across the screen and the palette appears, a grid containing 16x16 pre-defined colors and a row of random ones. Touch the stylus on a color and the user picks up the color. Touch one of the dots to select your brush size and away you go. Then

comes the good bit. Paint a blob of colour on the missing pixels, click on another colour and presto! another blob to get another colour. Paint until a message is visible. PaintShop can do this.

PaintShop is the world's best. It's totally easiest if you want. Images couldn't be kept, however can be stored in files, both compressed, unzipped and converted, and transferred in an instant. Access time for any image is 1.5 seconds. Pretty

Family Fun

"Learning Box" is a series of 8 complete programs based upon traditional children's stories. Each has an educational purpose to help children from 4 to 8 get ahead with their reading and counting.

More Than Just Software

Each Learning Box contains the program, a beautifully illustrated storybook, a recording of the story, an overlay to simplify the Spectrum keyboard and a step by step Parent's Guide.

existing but it also practices reading and spelling.

Each program has up to 7 activities and games of varying difficulty.

Order Now!

Make learning fun for your children. Order your Learning Boxes now and postage and packaging comes free. All 8 programs are available while stock last. All you have to do is fill in the order form and return it to us with your cheque or Postal Order. Or you can use your Access or Barclaycard.

Family Fun

While your kids are driving Mr Mac's car they're learning to tell the time. When they're concocting spells from 'The Magic Shop' they're learning to use money. Pulling up 'The Enormous Turnip' or escaping with 'Hansel and Gretel' is

THE IMAGE BENDERS

CONTINUED FROM PAGE 72

impressive when you consider that each frame only has over a megabyte of information stored in addition to this there is an inherent frame's capability of holding up to ten times images. Images can be pulled off the screen fast enough to be animated in just one frame. This makes it ideal for the animator who can't wait for his video to work in an instant and skip a few seconds. And easy can be taken on PowerBook, power slide, stereo movie film or video tape and be used to take images from other tape or video.

The possibilities are mind-blowing. Images in — you're making an ad for fast food and your heating lady turns up after a night on the tiles, bags under her eyes and a look full of sin. What? No time. Make over Mrs. put it into Photoshop, turn it into the heated and hot. It might look like Mrs. No problem. Richard Dean, one of the leading UK animators at Digital Pictures, made the TV commercial for Miles Services, the sandwich busters. He used the same techniques to make a whole square mile of London appear to drop from the clouds in a massive column of smoke.

In-type mode Photoshop can let users do a really comprehensive type-setting facility. Up to six hundred fonts are available and these can be rotated, enlarged/reduced, have shadows, be embossed or given thickness.

All this can create pretty impressive front-end page-printing in. Each picture contains just over one megabyte of information and because the system interacts with a host file, it needs to be presented fast. They can't work with files on a Spectrum or their photocopier doesn't handle it. Images, objects, etc., are stored as files on a 14MB HD which processes images at a rate of 1000 frames per second.

'But does it play games?'

MURKIN

Photoshop is made for Dazzle, the mouse of Parrotos, and is a must-have for manipulating video imagery in real time. Of course, there were existing systems for doing this prior to Photoshop inventing some of the effects they

use on Top of the Pops! but none come so versatile. Photoshop has many more built-in as a predesigned set of effects designed by the machine's manufacturers. Need a new effect? Buy a new machine. Photoshop has got a step or two that, if you need a new effect you just program it in. At no time before the effects can be programmed as a waveform and although it seems easy, then all you need is a piece of video to put in it, and it does it like the extra frame by frame as opposed to and make each point on the image directly addressable as a memory location. Of course this is a vast oversimplification. The way the addresses are stored is a bit muddled because each point needs to be referencing to the next point. For example, in an explosion effect, the relationships is pretty random. However that, Photoshop have sorted it out because the system works like a charm. There's just enough you can't do with it. Full-screen shows are easier and therefore images will follow the cursor, the corner can be sliced and folded over like a page turning or rolled into cylinders, cones or plates combined all over the screen as softness or sharpness that, when transferred and manipulated images are possible. Photoshop also cope with new images. For example, a simple page turn effect, the newest image can be swapped on the back of the first.

Because the image is programmed first and then connected to an individual cell where the video image is put in, it's possible, however, to use it in live television. Effects can be programmed beforehand and then called upon the air. There are also a set of pre-programmed routines for simple effects like poppers and splishers that can be called up by a non-programmer.

'OK, needs', a voice came over an intercom. We looked at the screen and the white frame bar had been earlier was replaced by a woman's face. As we watched the image went through all the ramifications we had seen the entire frame go through, folding into a cylinder, rolling around the screen and finally exploding into a mass of

fragments. Poor lady.

DIGITAL PICTURES

DIGITAL Pictures live in a basement in downtown Compton, California.

We decided to have a look at their newest flop; I was impressed. — I mean IMPRESSED. 300 letters from an impressed television and large headlines about and excited little people over the colors. You'll never know it was a computer graphics film, the title sequence from *Windows Movie*, due to go out in autumn, received plaudits of the major cities of the world. Then overall was amazing. 'What kind of power resolution do you have here?' I asked. 'About ten thousand by fifteen hundred,' Producer Paul Roseman responded proudly.

Digital Pictures is one of only two facilities for solid computer graphics in the land. Only a year ago it made a trip to the States. The programs involved are frightening. It also wants to get very close at all the necessary requirements, and therefore, as Digital Pictures' web personnel admissions says 'With state-of-the-art facilities you will be able to produce high quality images for your clients'. Here are two Dazzle CD-ROM movies. Because of a lot of internal thinking about they can address 'tens' of memory cells in case that isn't enough they've got a 100M hard disk as backing store. Good enough? They're a bit concerned though, because, you know, it's a computer system, Richard, Richard. Paul, Richard.

Richard, Richard. Hard disk spanked? He sits the book on the floor and continues. 'We're trying to avoid double memory but it's a bit slow. So we're thinking about using the memory bank as a file system to play around with and see if it really helps some fun.'

The rest beat of the system is a G3 120MHz Mac monitor, pointing straight at a Mitsubishi projector.

The book customer has an interesting film response. This was the power of open responsiveness for putting the digital image on film. It changes the interface from the Data Master, turns it into anti-aliased and puts it onto a heavy flat screen tube in front of the Macintosh.

The actual computing for this film is handled by the two Data Masters, all the software written in-house by Paul and his wife Chris. How do they get complicated shapes, etc., on the screen? Description of the objects is handled by a page of polygons broken into a Macintosh. Shapes are built by using polygons, every polygon is divided into mathematically and smoothed off by a method called 'Fourier shading'. Once the modeling has finished its code the Mac takes care. This is used to place and move the objects.

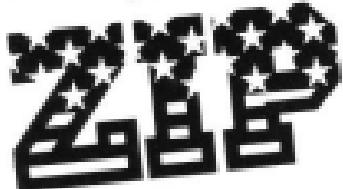

The images produced at Digital Pictures are impressive — there's no doubt about that — but reality is something that needs to be worked on. The problem is that this situation is not the same as the way the real life really, said Paul. In Japan they're looking at a recursive method that simulates the scattering effect of light. He showed me some pictures, a row of glasses, some transparencies, some refraction. They were as real as you could wish. The problem with this is that it starts to repeat itself. If you take each pixel down through just a few levels of recursion, you're talking biggs. We're working on it — same time next year we should be able to do better.

The end logique.

The author after finishing this article in short order.

BIG K's US report from MIKE GOLD ...

Pick of the crop

A year ago, folks were writing off once-mighty Apple. Today those crunchy Californians have shown the rest of us what comebacks are all about. MIKE GOLD reports ...

BOY, APPLE sure has had a good year.

First they shook everybody up with a truly scary television commercial — populated by a host of roughly 100,000 and directed by Alvin's *Military Boot Camp*. The spot suggested the best way to avoid it: George Orwell's 1984 was to purchase a Macintosh.

Then Apple really shook everybody up by actually producing the Macintosh on time and right on the money. While the failed IBM PC was retreating to paper-cutting, Apple's people lined up around the block to purchase the mighty Mac at full retail price.

When IBM released their much-hyped PCs, consumers took one look at the PCs and turned their noses up ... as did many critics. Priceless close to the Apple II, Apple immediately got an increase in sales of both the Mac and the II.

PORTABLE

Then Apple announced a cheaper, smaller, more portable version of the II called the IIc — now being touted in the UK. It runs most of the software written for the Apple II series, and industry analysts immediately gave it the thumbs-up sign. They predicted the IIc would outsell the PC this year, in spite of IBM's last-minute headstart.

Not bad for a company that, a year ago, some people thought would belly up.

But the best was yet to

come. Shortly after May Day, Apple's chief scientist Alan Kay decided to Apple Computer.

In the high-stakes computer game, programmers and designers are like movie stars, and Steve is Robert Redford. Alan was counting on him to help them engineer their reconstruction. He delivered — until this spring.

Now 43 years old, Kay a decade ago was an integral part of Xerox's computer development team. There he invented a little thing called the personal computer — an item Xerox placed over as having little consumer potential. Look, everybody makes mistakes.

WHISTLE

Interestingly, some of the technology that went into that Xerox PC hasn't surfaced until last year, when Apple released the original Lisa. It bombed, but its bells and whistles were plucked over into the Macintosh. With the Xerox-inspired windows and the mouse, Alan Kay should feel right at home.

Kay is a visionary. Whereas he diplomatically thinks the Mac is O.K., the IBM PC is — in Kay's words — "beneath contempt."

Apple's loss is Apple's gain. They're trying to recover from last year's \$600 million loss, and Kay's changing team will help.

Let's see if Atari strikes back ...

OUTSIDE CHARTER

... To no one's surprise, among the first programs available for the Macintosh are games — *Transistor*, *The Quest and The Clevered Alliance*, from Penguin Software. And here's just the Mac's cousin, the Mac II, and where would be Games for games?

By the way, if you take apart the Mac IIQD, you will discover built-in greatness that allows for other capability.

Over on the Apple II series, *Adventure*, released in late October, has re-titled non-violent games developed for girls: *Laura of the Dark Country*, *Jeney of the Prairie*, *Chelsea of the South Seas Islands*, and *Cave Girl Chat*. The company behind the confections tried trying to bring girls into the male-dominated hobby, but they presume if they honestly believe that "girls' interests" fit, anything greater than a marketing gimmick passed to overly protective parents may not get playtime.

These girls also have something else up their sleeves: they will be creating some of their own software in formats compatible with Apple II, IBM and Atari standards. Sounds like that's just what Alan did to Commodore.

And there is an intriguing surmise going about that the huge entertainment giant RCA is about to establish a "relationship" with Commodore that will give birth to some sort of joint venture. Best bet: Commodore will produce the goods for RCA's long-awaited release entry.

On the other hand, when RCA trashed their QED video-

disk system they suffered their biggest failure since one of their commutes locations was left open-off Intergalactic space. The QED was inferior to the recording system but not so inferior.

This is good news for gamers, as these old recording carts still at this high-quality hardware won't survive. Drag 'em Low was the last to be discontinued in the more popular QED system, sacrificing some of the pasties and most of the dials still found in the last version.

There's a lot of new stuff available for Coleco games and to and behold, some of it is good. From Coleco A, a 3D flying game, to one with the *Star Wars* and *Death Valley* titles, Coleco's *Cartoon Patch* dolls, carts from *Dragon's Lair* ... and from Mattel: *Galaxy*, *Police Pursuit*, *Jumpin' Moon Patrol* and *Jackie*.

Coleco's been re-releasing some of their already popular games in the extruded clam shell format. So here's the only question is ... have the games already given up? Coleco?

Alas, *Barbie Software's Campaign '84*, is a mockup of the American presidential election campaign. Over here, we turn our presidential elections into a year-long three ring circus, and Sunbeam managed to capture most of it. Candidates must choose their positions on various issues without offending too many special interest groups while at the same time dodging roving TV reporters. This game might not even do home after the election. Available for Coleco.

OUTSIDE CHARTER

It may come as a surprise to some of you characters, but words can exist in forms other than coalescences of pixels in a tasteful shade of amber. To renew our acquaintance with the wide world of volume, cuttlefish ink and teams of men in labours on multi-coloured character-sets, we pulled a few recently published books off the shelves.

Screen Dumps Aid Beeb Books

STEP-BY-STEP PROGRAMMING ON THE BBC MICRO
IAN GRAHAM: *Dorling Kindersley "Screen Shot" £5.99*

As letters to BIG K continue to prove, there is no sign yet of any lack of interest in great low-cost manuals for the more popular machines. Such manuals have been virtually silent since the arrival, but perhaps we have a contender in the excellently-produced Screen Shot series, available here for BBC but also available for Spectrum, Amstrad, Apple II and Commodore computers.

The format is easy-to-follow without being patronising or childish, clearly and expertly written with the best layout I have yet seen in a book of this sort. Totally absurd are the

glossaries of American jargon, or the obscurity of some British ones. Each of the large-format pages is dedicated to a particular statement or function, and examples are given and, best of all, superbly illustrated with actual screen dumps.

Considering the production quality and care that has gone into this series, this price of £5.99 begins to look far better value than anything else reviewed on these pages. Rich colours illustrate sections on colour, for example — what you see is (on screen) nearly what you get. Outstandingly good and for beginners or semi-beginners, highly recommended.

SO "DORK SLAYER" IS A STRING VARIABLE!

THE COMPUTER & VIDEO GAMES BOOK OF ADVENTURE
(KEITH CAMPBELL:
Melbourne House £5.99)
**EXPLORING ADVENTURES
ON THE BBC MODEL B**
(PETER GERARD:
Dashworth £5.99)

As mentioned elsewhere on this page, adventure theory never suffers from explanation. Nor that reason. There is no shortage of explainers. Both these books tackle the subject fairly, with Campbell using his theoretical bias to construct one well-explained master program while Gerard manages to

EXPLORING ADVENTURES on the BBC Model B

give us three in about 40% more space. Both men clearly know their stuff, but where Campbell briefly takes on the entire field of microdots, Gerard addresses one machine solely — perhaps the least suitable for adventures, the BBC B machines. Using either book you could learn the essentials of adventure-writing — or you could just go out and buy *The Quill*.

— CHEAP BUT C·H·E·E·S·E·Y —

On the way: *Intelligent Games for your IBM Computer Quality Games for your CB Computer and Pedestrian Games for your PC/XT Computer*, all by good old Hal and Steve (or not, as the case may be). And guess what? They'll probably be the same hopefully as all games listings as we have here, since what Hal and Steve have drilled up for Com-

CRAZY GAMES FOR YOUR COMMODORE 64
(HAL PERKIN & SAM IRVING: Addison Wesley £3.99)
AWESOME GAMES FOR YOUR ATARI COMPUTER
(HAL PERKIN & SAM IRVING: Addison Wesley £3.99)
ASTOUNDING GAMES FOR YOUR APPLE COMPUTER
(HAL PERKIN & SAM IRVING: Addison Wesley £3.99)

missions in this first fine collection, they also dish up — give or take a listing or two — for

these four other 6500 machines, the Amiga and the Atari. Also, the games are good?

Who knows? Probably after all the namesake they need of whatever transportation they have to be. These books are of course American best-sellers, and are pitched at the mass user rather than the, but not so keen to understand any of it. One stage up for them from simply buying software and running it (in which case Hal and Steve are definitely cheaper), and one stage on for those from buying a load of computer magazines (in which case both Steve and Hal will manage 20 pence a month, and probably more expensive). In this last analysis, I've a feeling that the buyers will want some documentation with their software when they buy it at the price — or just maybe, depending on your outlook, I guess.

Null Order Protection Scheme

If you order goods from Mail Order advertisements in this magazine and pay by post in advance of delivery, BPC UK will consider you for compensation if the Advertiser should become insolvent or bankrupt, provided:

(1) You have not received the goods or had your money refunded; and

© You enter to the Publisher of IGI Publishing by the Author

Please do not wait until the last minute to inform us. When you write, we will tell you how to make your claims and what evidence of payment is required.

We guarantee to every claim from readers made in accordance with the above procedure as soon as possible after the Advertiser's publication.

This guarantee covers only advance payment sent in direct response to advertisements in this magazine not, for example, payment made in response to catalogues etc., received as a result of answering such advertisements. Classified advertisements are excluded.

Dept K, 76 Westbourne Terrace, London W1

**Now YOU can go for gold
...with the **

Even giving yourself against the world,
but at the same's flower?

You can do as without going anywhere near Los Angeles — with the most challenging packages of courses of 1966.

MICRO OLYMPICS is more than a game. It's a brilliantly written collection of ELEVEN track and field events.

And because you know we're going to sell many thousands of them we've brought the price right down - to just £5.95.

Ever imagined yourself as another Bob Beamon? Then try to run against the world record holder at 1000 metres. And if that distance is too much for you then there's always the 500, 350, 400 and 800 metres to have a go at.

Not much good at running? Don't worry. MICRO OLYMPICS has many more challenges for you. Why not try your skill at the high jump or the long jump?

And if you can't beat the computer at running or jumping then you can always throw things around in frustration! The trouble is that it's just as hard to be a champion at the disease, the hammer or the tools.

And the girls really take the event to new heights!

Yes, it's fast, below the pricing yourself against the world's best times and distances on your routes.

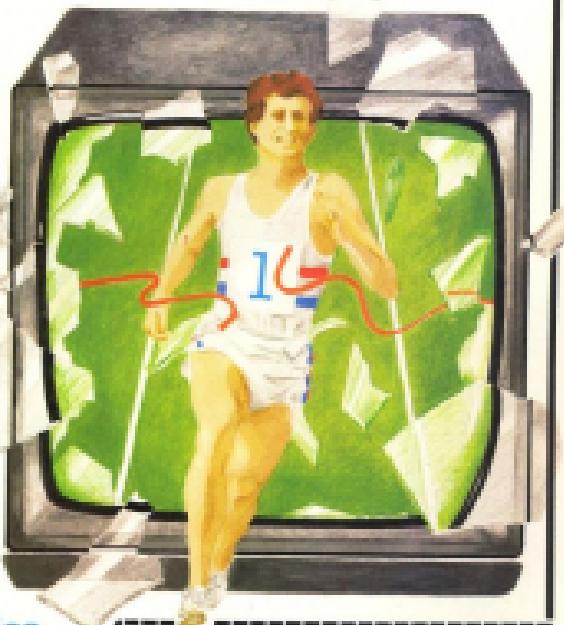

You may not be another Steve Brett or Alan Milne, but with practice you could become the Miss Blenheim Champion!

Also available from IBM Smart-
card and other dealers.

Play Micro Olympics – and let your fingers do the running!

QUALITY ARCADE ACTION GAMES FOR THE

COMMODORE 64 at £7.95 each

GALAXIANS

The earth is being invaded by alien force, the GALAXIANS have arrived from a dying planet, determined to destroy civilization as we know it.

They come in formation, swooping and diving towards the planet earth. You and your crew can save mankind from the terrifying destruction the aliens threaten us with.

Galaxians £5.95
A fantastic version of this popular arcade game.

Robin to the Rescue

In days of old when knights were bold and the sheriff was in power, to play this game guide Robin Hood, to Marion locked up in the tower.

New Bogy Man

When teddy to the picnic went there come the smell of honey so off he went to find the hive to fill his empty tummy. The bees then guard honey pots are sharpening up their stings as teddy hits his empty tum sweet melon he sings.

£5.95

All our games are available mail order P&P included
from the above address. Orders sent by return post.

Also available from all good computer shops.

New Valley Cat

Guide Thomas the cat along the 13 walls of SOLARIS sheet to his lady friend, who awaits him on the end wall, but beware of the flying boots, bottles and traps, which are just a few of the hazards you will encounter.

New Bogy Man

Guide Boris up the ladder, to collect a coin from the top of the screen, but beware! the bogey men are out to get you. He must return to the bottom of the screen, avoiding the bogey man and insert the coin in the electric meter. When the meter is full the lights will come on enabling you to see the pitch fork, and after retrieving it, kill the bogey men.

ADVENTURE GAMES FOR THE COMMODORE 64 (R. J. BRADBURY: Granada £5.99)
 COMMODORE 64 GAMES (KEVIN BERGIN: Duckworth £8.99)
 GAMES COMMODORE 64 COMPUTERS PLAY (ROBERT YOUNG & ROGER BUSH: Addison Wesley £9.99)
 COMMODORE 64 GRAPHICS AND SOUND (STEVE MONEY: Granada £5.99)

Why £8.99? What is it about this particular price figure that makes it so right, so appropriate for publishers of computer books? In fact it's a truism that most computer books are ludicrously overpriced, certainly compared to computer magazines. The assembly and (more importantly) documentation of a

ME AND MY COMMODORE

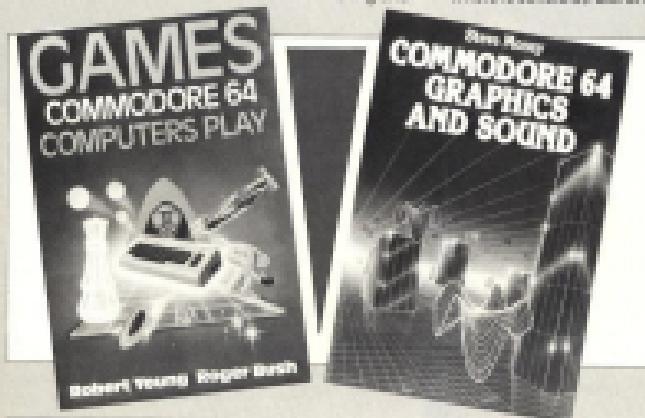

handful of decent games for the ubiquitous C64 is not the easiest job in the world, true, but neither is it the hardest. Young and

Bush give us a mixed bag of twenty, all nicely listed in "untranslated" versions which on the whole is sensible. But on

the whole they don't go as far as they might into the business of explanation.

Better in this regard is Kevin Bergin; he provides 70 games, more randomly mixed. Again games (those short adventures those utilities through the lot — each of these, by the way, is the size of a good-sized magazine version).

Granada's two offerings, by Bradbury and Money, balance evenly between how-to manual and example listings. Certainly there is a need for specialist volumes on the 64 to explain all those things the official manual leaves out. Both these books are well thought-out, and Money's can also serve as a dedicated game-writing manual. Bradbury takes us deep into adventure theory — sentence parsing, grandfather-father-objects, cell structures for locations, and so forth. The tortuous splitting-off involved in adventure structure is very clearly explained throughout.

Slinky brown stuff

SPECTRAVIDEO COMPUTING (IAN SINCLAIR: Granada £5.99). THE MICRO USER'S BOOK OF TAPE RECORDING (MIKE SALEM: Duckworth £2.99)

Despite glowing reviews when they first appeared about six months ago, the Spectravideo range of computers (now, actually) have not yet exactly taken off like polecats. Perhaps, as MSX draws near, their time will come. In the meantime Granada, clearly with an eye on MSX, have issued a second field-user manual for the cheaper Spectra machine, written by the respected Ian Sinclair (no relation). It's an honest and reasonably thorough piece of work,

no frills, and I like the way Sinclair opened up to the fact that hard users know how to re-program the function keys.

Assuming tape recording is your thing and the sight of reels rotating sends you into spasms of ecstasy, Mike Salem's lot (geeked!) of knowledge on the subject should fill you with joy. Mysterious sub-topics like Head Azimuth Angle and Cassette Interface Waveforms — all perfectly useful stuff, I'll be bound — grace the 90 pages of this slimline but learned little tome. Sorry that plod! Clump, that EPROM! Cassette and all other forms of slinky brown stuff are here to stay. At least, if they're not, then Mike Salem is in bad trouble.

SPECTRAVIDEO COMPUTING

It's never been easier to buy a home. From the moment you apply to closing a new mortgage, we're here to help.

ARCADE ALLEY

NETWORLD 1990

T

HERE'S NO mistaking the Tazos T-21, listed in one of the oldest of arcade staples, the simulated racing car game.

For a start, it's almost as large as the real thing. More eye-catching, there are three screens rather than the usual one; the panoramic view that ensues is quite striking, particularly — once you get

that far — in a night-time sequence. Otherwise, I suspect, that the triple screen effect is more of an appealing gimmick than an aid to the game itself. Because although there is a much broader perspective than in the usual one-screen games, there's no real use of the three screens, within the continuities of the game itself. (You can't, for example, see cars approaching (creeping!) from a distance — so far as this particular could make out anyway, all the action occurs on the hori-

zontal central screen.)

Still, it does look good.

Tell a lie: on the left-hand screen there is a small inset of the whole course in which you can glimpse your overall progress. Mind you, the 'race' takes place at such a clip that a novice probably won't have the time or the inclination to look away from the lead ahead. There's a brake, acceleration and a two-speed (High, Low) gearstick. The wheel controls are hairbreadth fine — as presumably they are on the full speed real thing — so that the slightest movement has its effect.

Being a non-driver, the nearest hint of a save is in the monitor had me over-

JOHN WATSON-MET GIOVANNI DADOMO

ing wildly. The first indication of this happening is when you hear yourself skidding; fail to check that and you go into a spin; unless you're quick and control your motion there's a good chance that disaster will occur when your vehicle hits one of several thoughtfully placed billboards, walls etc. The race takes place in four progressive stages; if you get as far as the last of these a flick of the wheel enables you to choose from one of eight Grand Prix circuits —

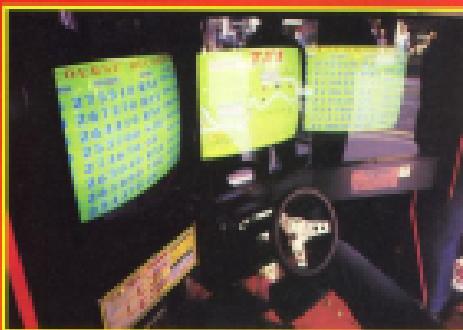

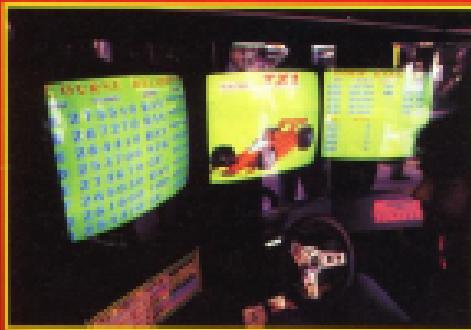

Munich etc. etc. Whether these are actual replicas of the real thing, only an expert could tell you. As a non-driving layman it's all pretty convincing. After only one amateur play I had three broken ribs, a fractured leg, seven burns all over my body and irreversable brain damage. I left the arcade with a statuette blonde on each arm and a magazine of snapshots of my lips. It has to be said: after £30 any ordinary racing game is ... just the pits!

Letters to BIG K

WANNA WIN
A FIVER?

You you too can join the formidable team of serial assassins on this here double-page spread and end up RICHER by FIVE WHOLE POUNDS! (If we publish your letter, that is.)

Mail your wall to . . .

Letterbase,
Big K,

Room 2338,
IPC Magazines Ltd,
King's Reach Tower,
Stamford Street,
London SE1 9LS

Combien?

I HAVE written a couple of programs myself and would like to know how much Big K pays for them.

MARK HAYES,
Blaizepool.

• We don't have a green flood bar, as the quality, originality and sheer graft that goes into progs varies so much. Housepublished minimum £500 up to £1000 on the sliding-shovel-scale!

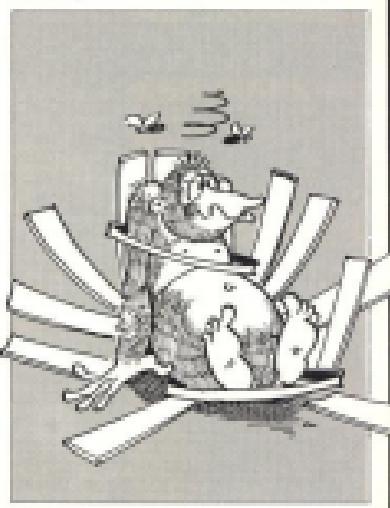

If you do want your prog to get a quick going over, note that priority is given to those with clear documentation attached. (And label your cassette clearly! I frequently ask if you have the techniques.) It is a prog tastefully presented in its own 40 column print-out.

APE FAN

WHAT'S KONG game do you think is best for the Commodore 64?
ANALOGUE NIVADI
London

• We just don't know, since Kong's. The truth is, we can't abide "real" Donkey Kong that shatton anthropoid's barrels for other platforms just doesn't fit our collective consciousness. Tell you what, tho'. We'll give £5 to the Kong fan who can convince the most awe-inspiring and convincing plug for his personal choice. It had better be good. You never know, you might get spotted by Saatchi's, and make your fortune by selling off to the Arab states. Me? I'm still waiting to be spotted.

An Irate Pensioner Writes

THE Video Recordings Bill was brought in response to industry-initiated lobby, such as film producers and the current TV producers (who would probably peddle their own Starving for instance), chosen to pander to the sick-minded and perverted in the hope of cash.

As I write, very few grandmothers are busy playing and enjoying a "classic" computer game. No one dares to buy violence in the "team" of "The Fall Guy". The solution is to uncheck programmed associated by exploiters, parents and sedates in their unprincipled efforts to profit wealth.

MR LUDLOW,
Middlesbrough.

• We're not wild about punks and sadists either, Pope Ernest. What Big K stands for though is to allow legislation on very important legislation that could have far-reaching effects for us all. If we're going to have censorship, then the Who, the How, and the Why must be debated in public. And let's make it specific on this vast, important, popular and unique industry. It's not only indecent-but sponsored to try to hang in old games with legislation existing for miles.

The incomparably named Mr Blight will find in his dictionary that word simply means "lousy". Both films and games require "feeling", but apart from that, they just ain't the same ball game at all.

Let us reiterate. There has been NO actual prosecution in this country for "video game obscenity". And there's no real evidence of Marquis de Sade types writing programs, either. Don't panic.

No Subs,
Use Force

I WOULD like to take this chance to add my voice to that of your general readership.

ADRIAN MURRAY,
Exeter.

• Whoops! Sorry Ade, and all those others who have written in asking for local action. I shall be pleased that has been so great that we've had to make repeated and increasingly frantic apologies. Local news organisations will be heavily available, the only solution is to play those papers, seek out editorials and letters over the counter of your nearest newsagent and then release day after day. But no, listen, please. On straight — point blank.

Earnest plea

I AM the World's Greatest George User. Well done — for actually caring for an old bloke. Despite Doctor Who, it's not Doctor's fault that they didn't get out messages out in time.

ADRIAN MURRAY,
Exeter.

• Why isn't Dr Who's "Puffin" Answer something we close in?

K edited by NICKY XIKLUNA

**Yours Unrepentantly,
A Software Pirate . . .**

YES, I do copy programs from friends' tapes — and I make audio copies using my tape decks. I know it's theft and I honestly don't care. Here's why. Computer software, in the main, overpriced rubbish. Just like music. It has a lot of records and I also have a lot because I have been blessed enough by record companies. It's just that a record is quite a lot, considering an average of 450 goes to the musician. Alright, you may say that isn't helping like poor people very much by lifting the songs, etc., but I'm a software manufacturer myself. Somebody like David Bowie or Sting is hardly going to mind loss, and anyway, there is something in the laws of patent about copying which the anti-tape brigade repeat mantra.

It is not unusual of patent to manufacture a copy of the patented article for one's own use, or to give a copy to a friend. It seems record companies and software houses represent the best of both worlds. Study the Copyright laws and Patent laws are brothers under the skin, so surely home taping is partially legal?

I would be less inclined to copy software if it were better valued for money. It is recorded on really cheap quality tape, little packaged, poorly illustrated (in, for instance) and as far from standard of English . . .

Finally I am very shocked that you should wish to kiss the asses of the software houses with apathetic, anti-tape piracy attitudes. Why on earth didn't you raise the points I have mentioned? Does it mean you have a personal interest in a software company? Or do you just want to keep your advertising secret?

I'd like some feedback on all this, from readers, writers, and companies themselves, without the waffle above loss of profits, etc., because I don't care. I just want better software and at a lower cost, and I need it now!

PAUL BELLAMY,

Silenced.

On occasion it's perfectly possible to take the full-blooded anarchist point of view, as you have. It's no more than the truth than as the magistrates who make and sell programs and records are all up rich, they won't mind your losses. I think you destroy your own case, however, by saying that you would be less inclined to copy software if it was better value for money. Why "less inclined"? Aren't more business minded shouldn't be dictated by taxes and bourgeoisie considerations of things like "value for money"? And isn't it true that people like you would still feel aggrieved and expect off end if it came free with the milk? Ergo, you feel exploited and you want revenge. What's that? . . . but don't claim on a moral argument about it.

Do I have a personal interest in a software company? Well, do I need to keep my advertising secret? Of course, but not at all costs. And this problem affects all software makers, not just those who have the incredibly good taste to advertise in BIG K. — TONY TYLER.

Slow down

I'M SURE that a lot of people who have computers don't know or understand everything that is written, so an instant study in plain and simple reading people's English would be welcomed by a great many people.

R. HARRIS

Leeds.

WHY DON'T you get a learners' section in your magazine?

JOE BENSON

Limerick, Ireland.

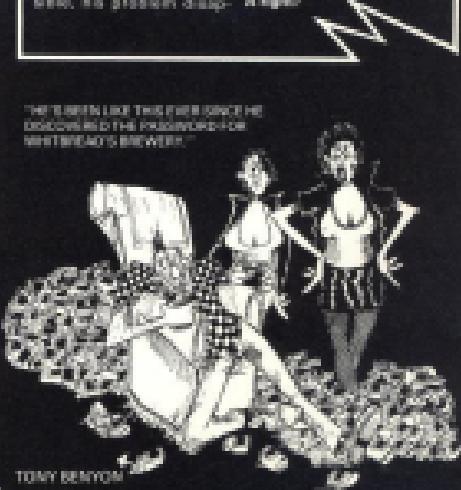

• The aim of Big K is to pitch at all levels at once, so there's something for everyone in each big job. You'll pitch up more than you realize when you're having fun — so stop worrying about their catch-all setting bits, get your head down and enjoy!

LINE NOISE

BY PATRICK WARD who has had his problems loading in games as the Player. However, he discovered that by raising the power supply to nearly twice the level as normal, his problems disappeared.

■ While your radio voice gets tingling seas a nearby dose of "line noise" (illustration) that anything metallic that's connected to power lines will act as sort of radio wave transducers. So even though static charges may stick with indifference or general malingerence, it's worth having a quick look checks for your proliferation. Aight?

"THE BURNED OUT TELEPHONE LINE DISCONNECTS THE POWER SOURCE WHICH BREAKS HIS WIRE."

TONY BENYON

Ripped off

NEXT TIME you need a spell, could you please put some useless advert on the reverse side, or make it double-sided, or go on-line with a masten?

A. BUDGER,

London.

• We had no idea, DJ! Didn't think you'd treasure our Mike Mole 'He wrote' piece so dearly. Just for you, we're going to use the Bad Moon. Meanwhile, I've got to calm down the folks who interviewed Mike Mole. Thanks to you honest b*stard he's written a classic.

ATARI GRAPHICS

Using Ande mode 4

The best use of this mode is with a modified character set. Using this you can create some very colourful effects on the screen.

The following program allows this to make some coloured bars on the screen. As you are going to only use 4 characters there is no need to copy the whole character set across and I only define the four characters that I will be using, i.e., A, B, C and D (as far as memory is used).

```
110 DATA A,B,C,D,170,26,170,
150,170,85,120
120 FOR Y=1 TO 20:FOR
X=1 TO 8:
130 PRINT#1;"A";NEXT X
140 PRINT#1;"B";NEXT X
150 PRINT#1;"C";NEXT X
160 PRINT#1;"D";NEXT X
170 GOTO 100
```

As you can see there are four stripes of different colours across the screen. If you wish to add a few colour variations change line 110 as below and add the other lines:

```
110 DATA A,B,C,D,170,
POKE 101,MEHTOP$-100
20 GRAPHICS 0;SET=1
30 MEHTOP=47*256
30 DL=PEEK(560)+256^2
PEEK(560)
40 POKE DL+3,88:FOR X
=8 TO 26:
50 POKE DL+0,X:NEXT X
60 FOR X=0 TO 26:READ A,

affect printing all of these new characters in the inverse mode (i.e., after pressing the Atari logo) each has on their colours. The only one affected will be the blue 'A' which becomes purple. This is in fact the true fourth colour. The 'A' is actually a mixture of 'B' and 'C'. The best way to find out what colours are possible is by experimenting. Do not forget that you can change the default colours by using either the SET-COLOR statement or by POKING the colours directly.

As I promised last month both modified characters and Ande mode 4 will be used to create a game for

next month's issue. I am glad to report that it is now well on the way to completion.

The idea behind it is that you are in a power boat going down a river in order to navigate your way safely you will have to blast boulders out of your way. The screen is in Ande mode 4, that means, no borders and the boulders are all rendered characters and the boat with its turbines are going to be player missiles. Despite the fact that the game is written totally in Basic with absolutely no machine code whatsoever it still runs quite fast. To find out how fast next month's copy right now!

SOFTWARE

DOOMSDAY CASTLE

Is an arcade style game
with the feel
of a real adventure

Doomsday Castle consists of a labyrinth of 76 complexly inter-connected Halls and Passages, where you will meet a whole host of adversaries serving the infinitely evil Scarthax, the Garthrogs, the Orphacs, the phenomenally nasty Googly Bird and the Links which manifest themselves in over fifty unbelievably weird and wonderful guises.

Scarthax has scoured the Universe to bring together the six ancient stones of lifeforce. United in Doomsday Castle they are being used to wield an irresistible power over the cosmos, emanating waves of corruption through every galaxy.

To save the Universe, you must battle your way through the Castle to find and collect the six stones and use their force against Scarthax to destroy Doomsday Castle, hopefully escaping yourself before the final cataclysmic explosion.

The task is not easy (saving the Universe never is!) and it will take you many games to unfold the structure of Doomsday Castle and discover the locations of the ancient stones. The addictive arcade style action will keep you coming back to play but the overall challenge should still keep you occupied for months.

FANTASY SOFTWARE

is available from
W.H.SMITHS, JOHN MENZIES,
LASKYS, GREENS, BUMBLEBOMBS,
SPECTRUM GROUP,
COMPUTERS FOR ALL and all other
good software retailers.

You take on the role of our super hero DOOM shown here above in his exasperation
Catastrophe in combat with the life-alienating anti-parasitic gangplankers! This is a cover
representation of the on-screen graphics.
